

Data visualization for researchers

Crash course

Guillermo Marin

What is visualisation?

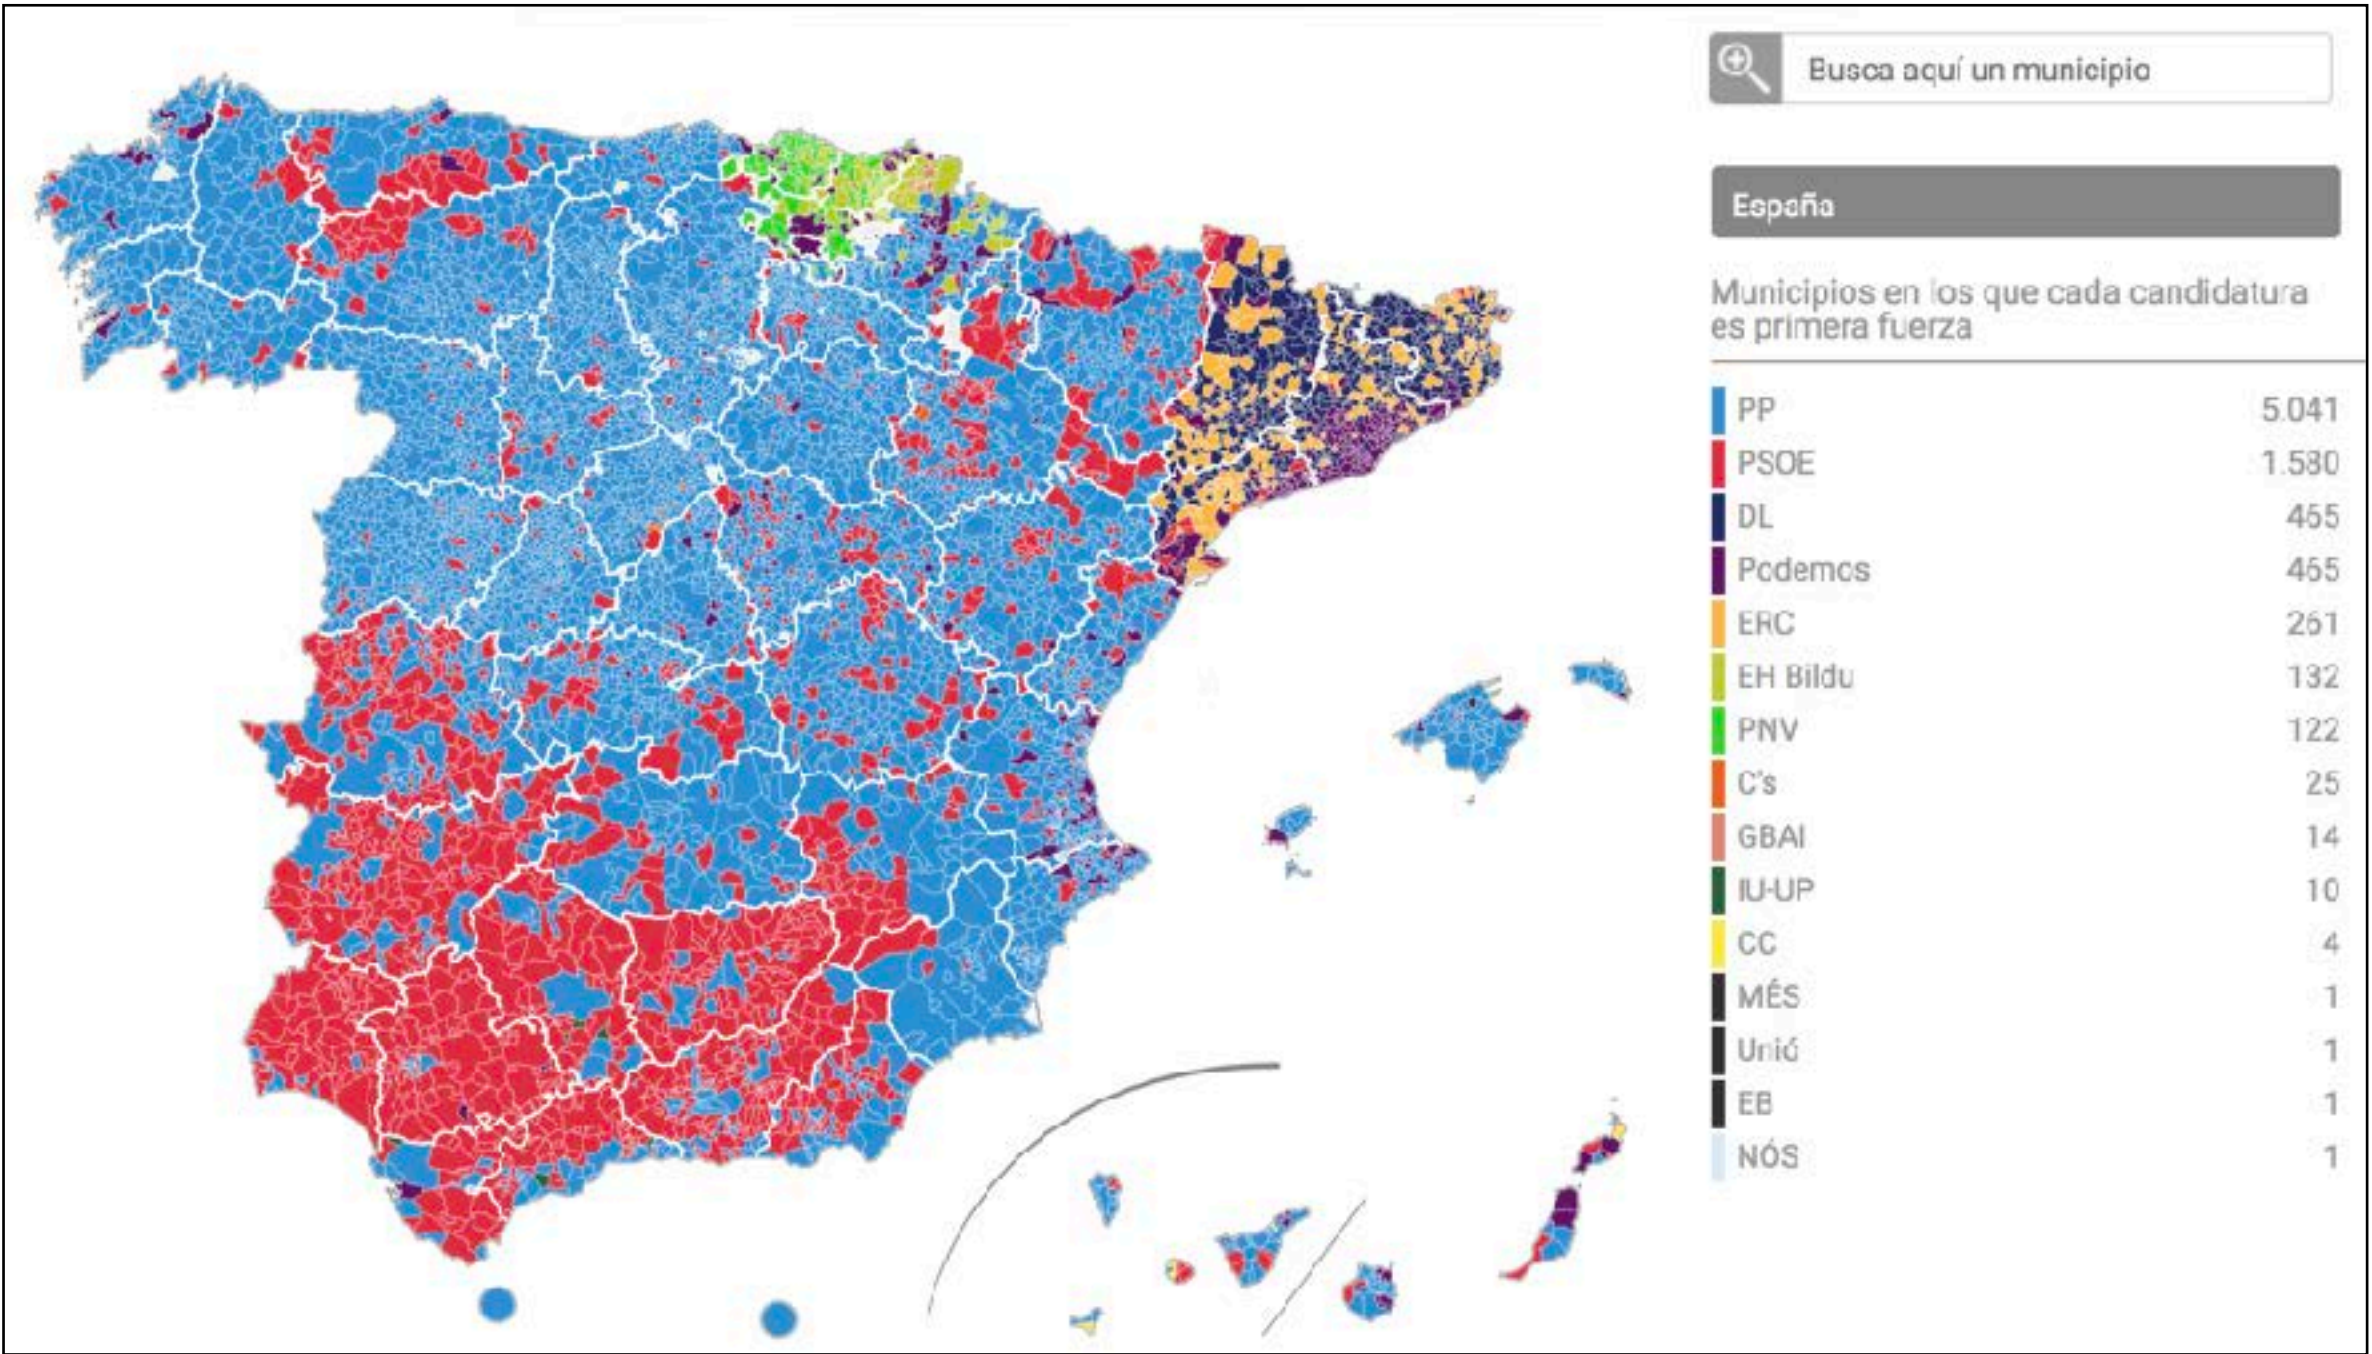

The visual representation of complex information in ways that lead to insight

Limited capacity to extract information from abstract representations

Visualisation

Data Viz

A display of any kind of data

Information Visualisation

A display of other types of information

Scientific Viz

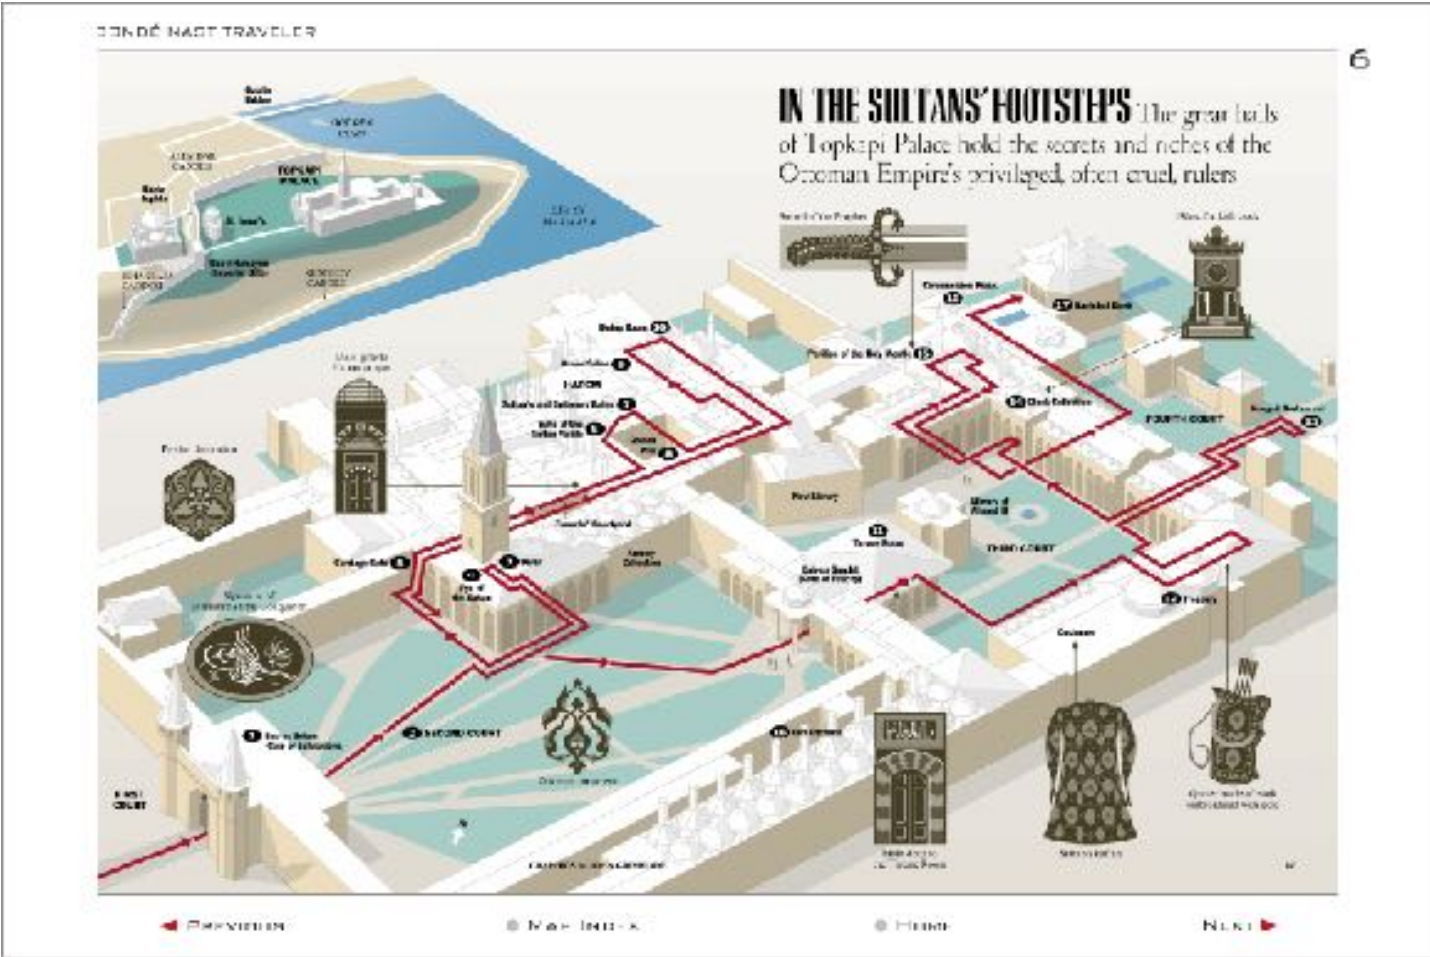

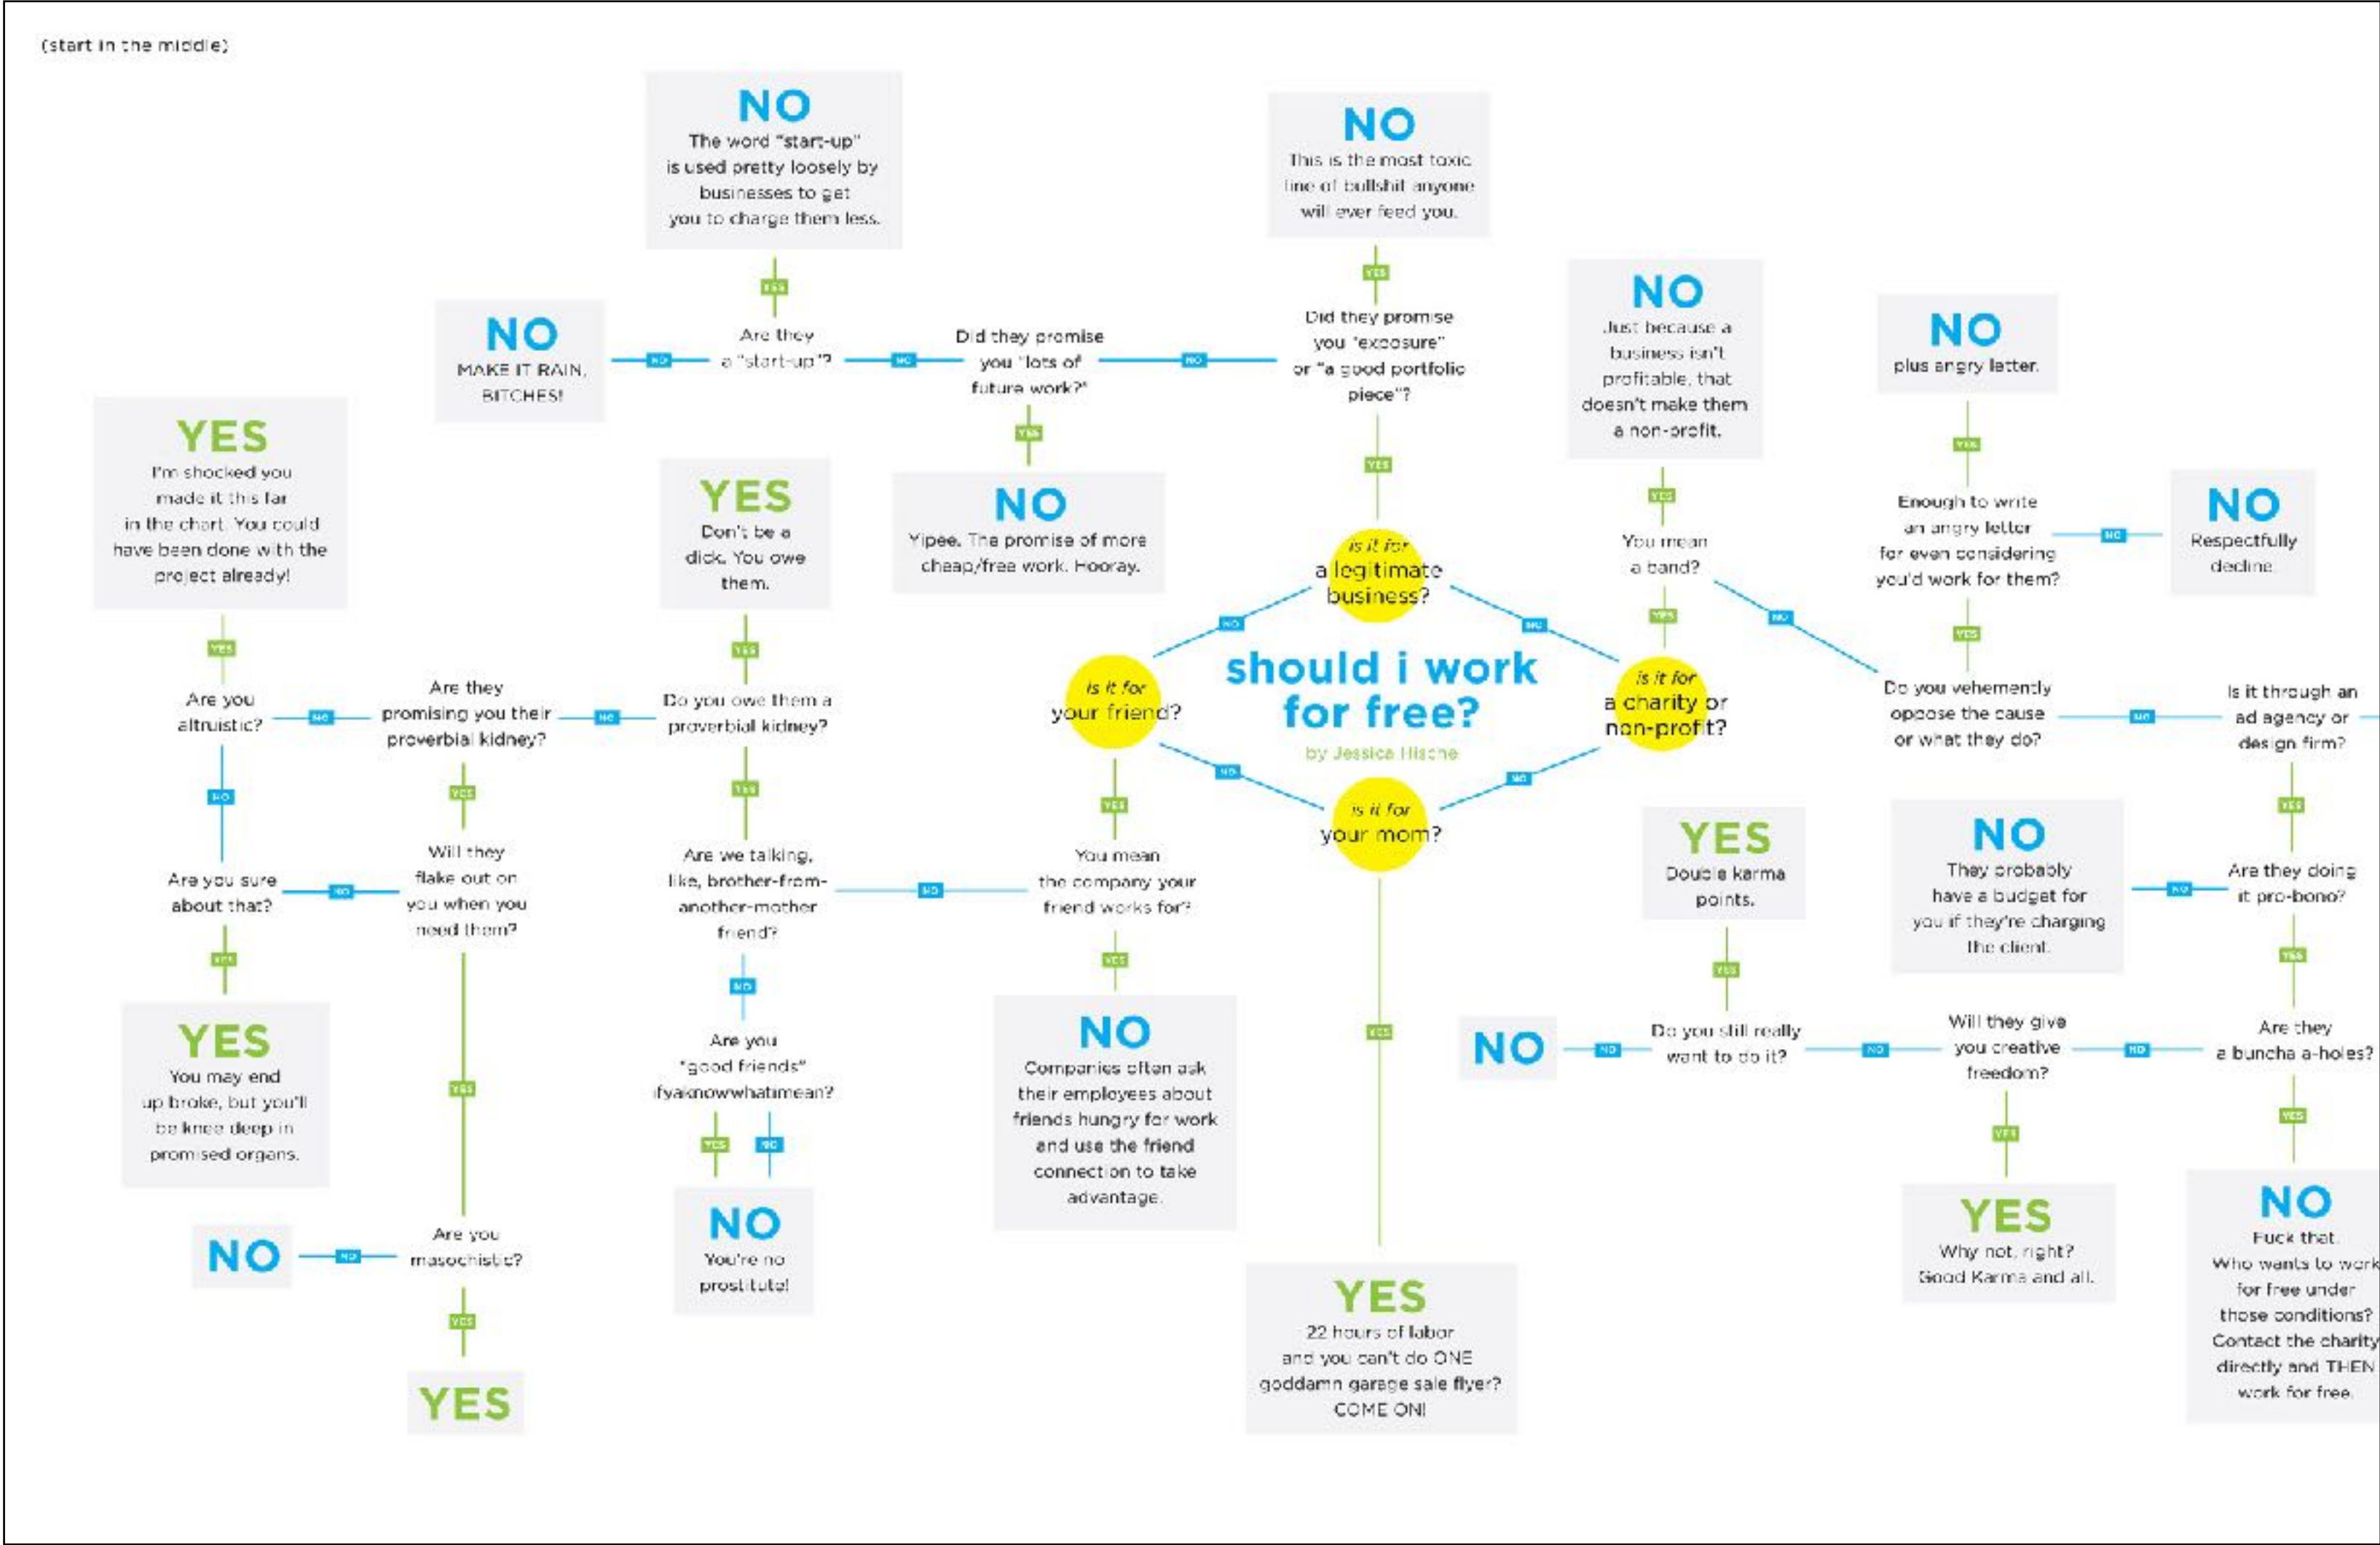

The visual presentation of scientific data (medical, GIS, physics, etc)

Data Viz

Info Viz

Scientific Viz

- Medical Imaging
- Math
- Simulations of physical phenomena
- Geographical Information Systems

Data everywhere, visualisations everywhere

Infographics

Multi-section visual representation of information intended to communicate one or more specific messages

John Grimwade

Data physicalisation

Data food

Who cares?

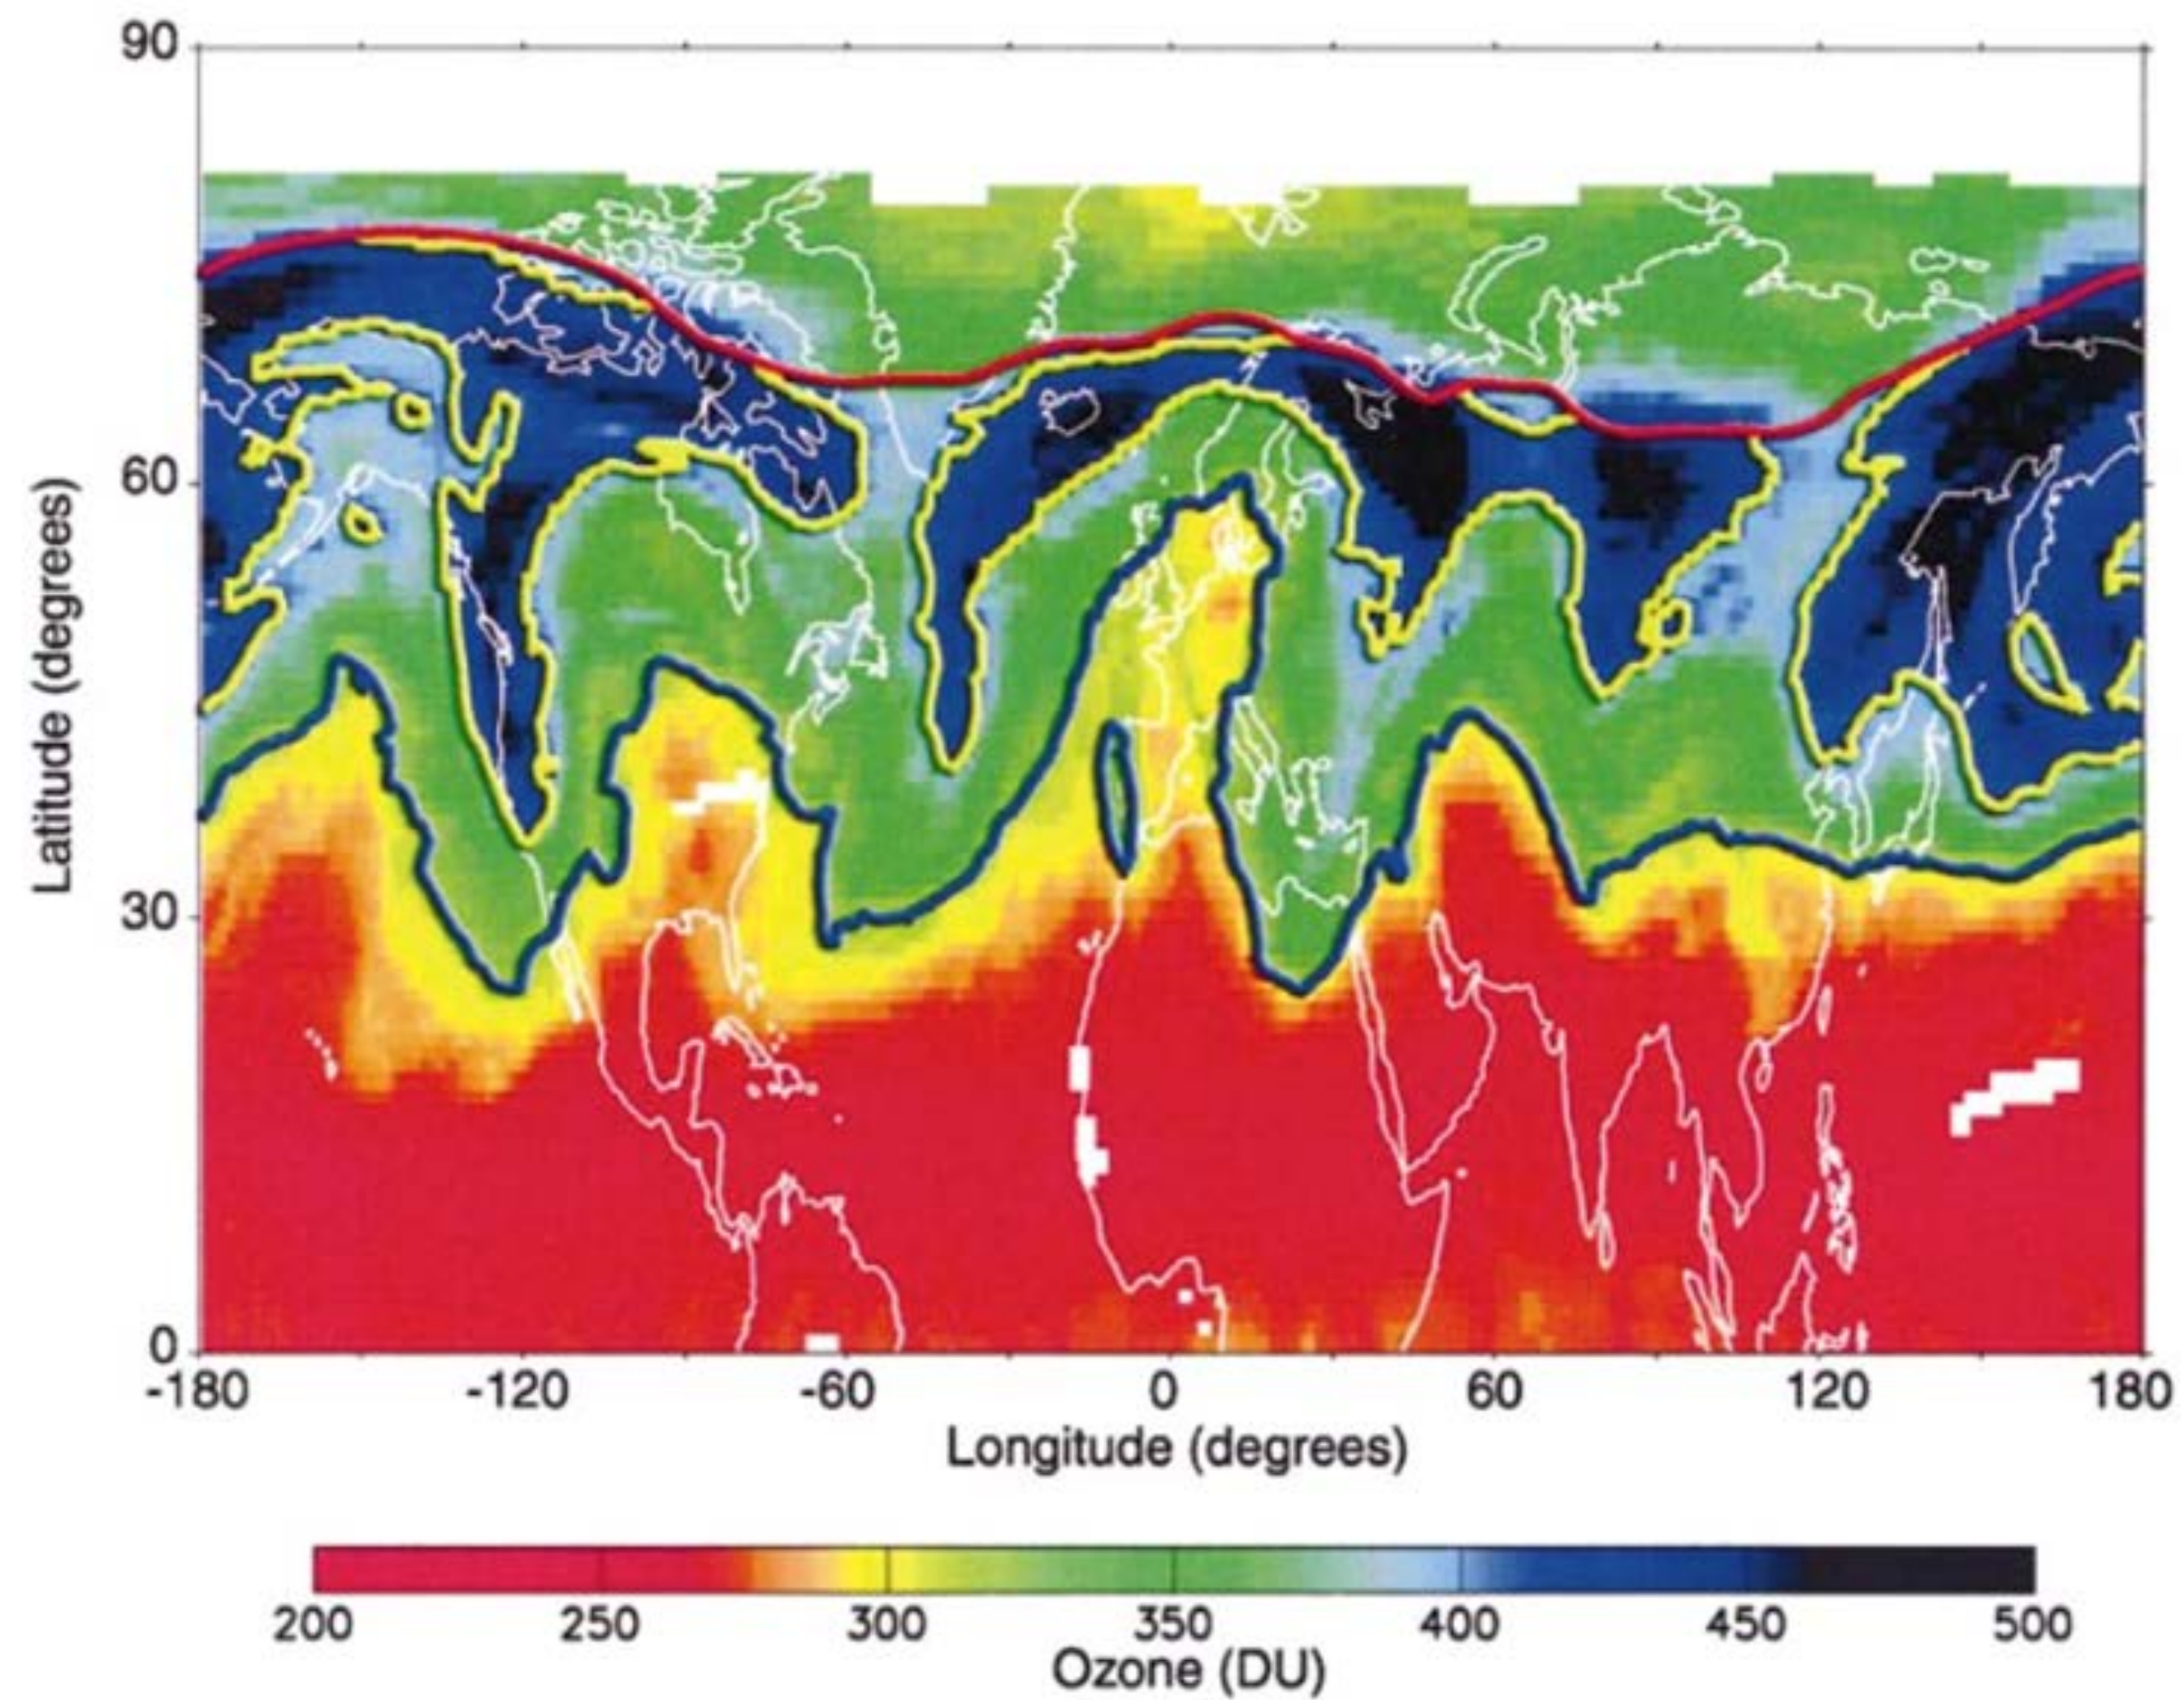

Defaults don't work in all cases, and software don't fit all data
A wrong choice of chart or design decisions can lead to mistakes

Even to distort the message

Even to distort the message

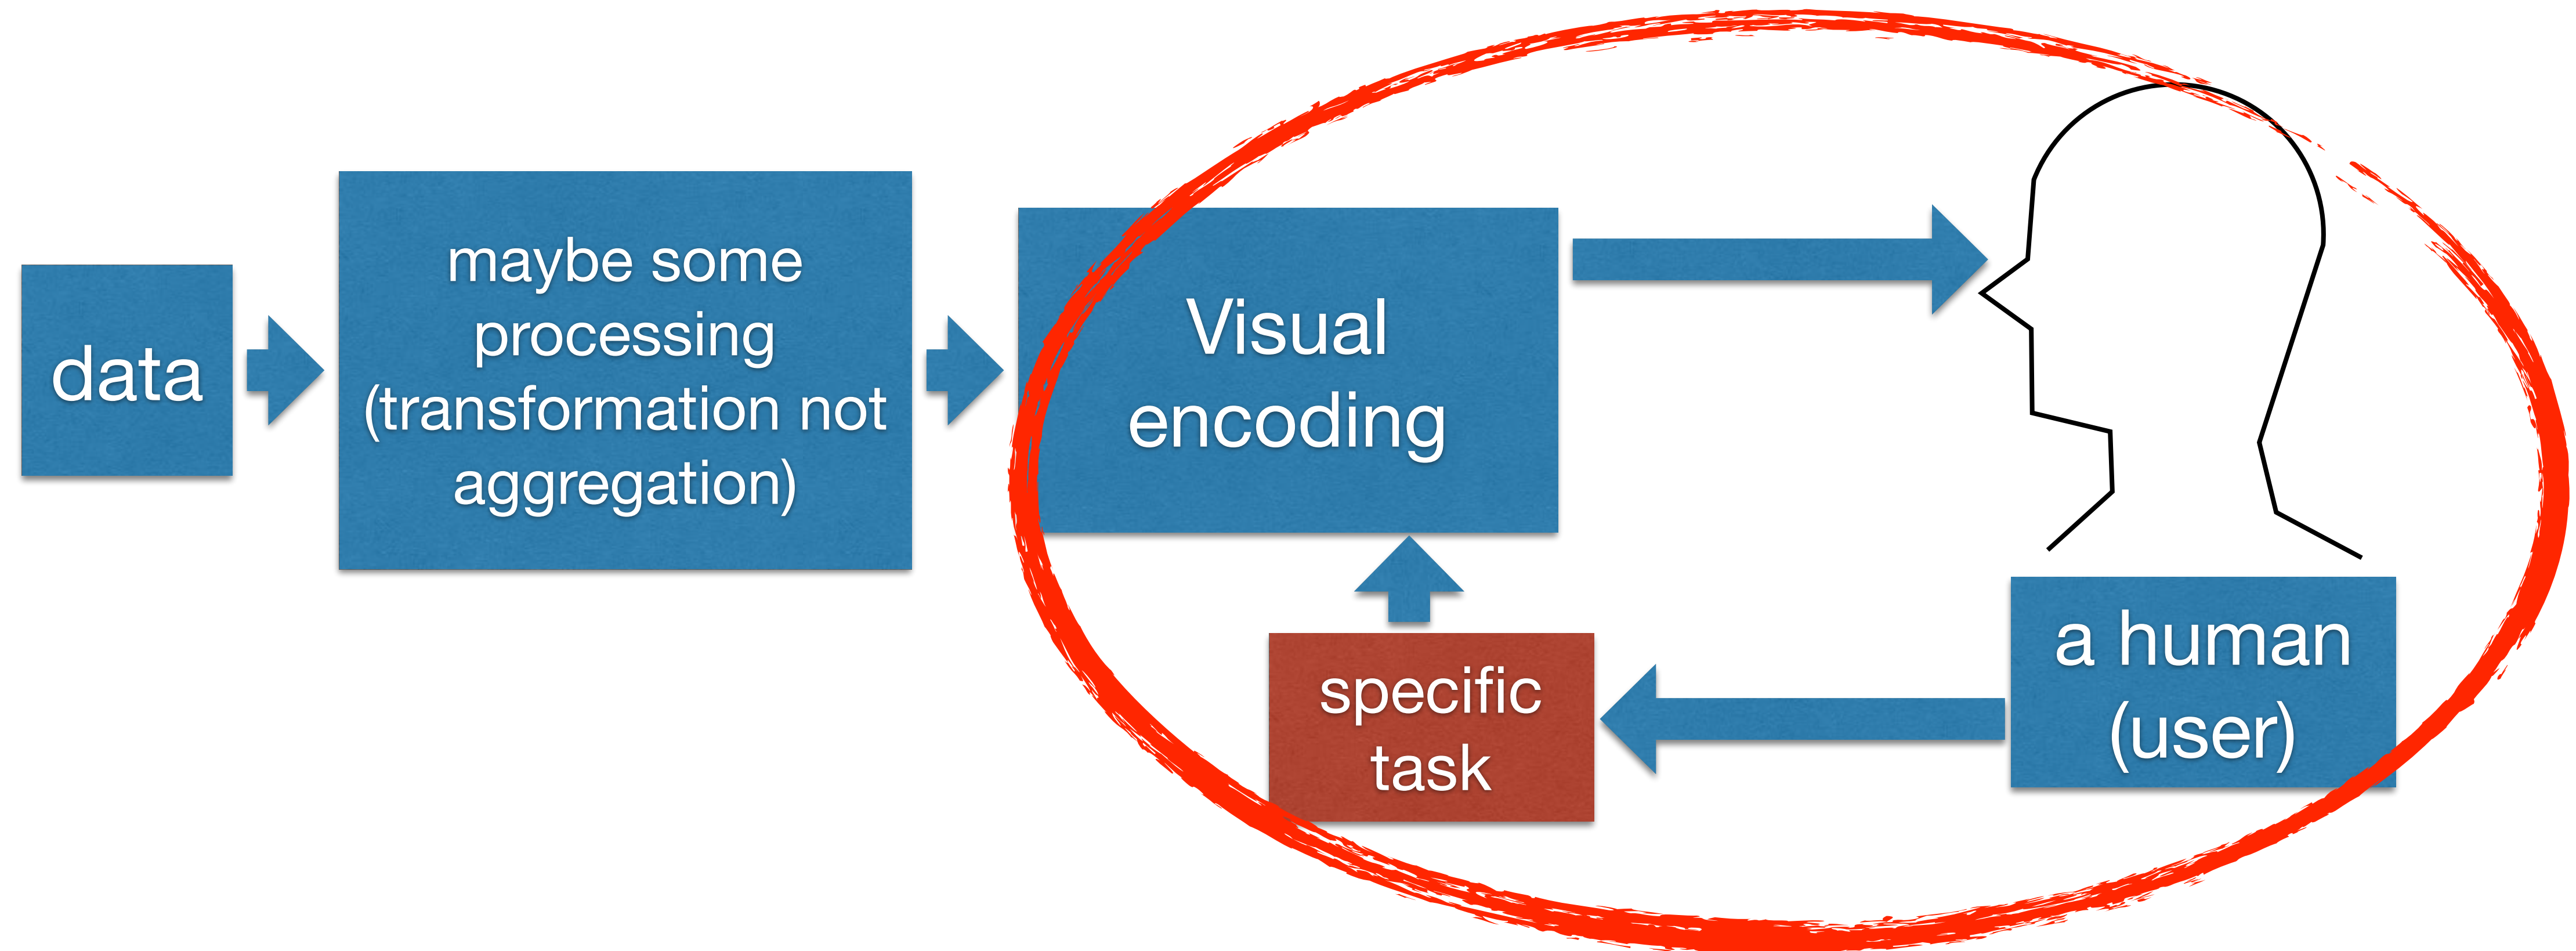

Hudson, R. D., Andrade, M. F., Follette, M. B., and Frolov, A. D.:
The total ozone field separated into meteorological regimes – Part II: Northern Hemisphere mid-latitude total ozone trends,
Atmos. Chem. Phys., 6, 5183-5191, <https://doi.org/10.5194/acp-6-5183-2006>, 2006.

What is visualisation?

Cognitive tool to enable analysis, exploration, and discovery

Focused on user/task

Mixture of other disciplines (cartography, statistics, graphic design, neuroscience, computer science)

(T.Munzner)

Summary

Data, charts and visual encoding

Visual Honesty

Graphic design

Storytelling with data

Data, charts and visual encoding

Data types by structure

Chart types by function

Encoding: Visually represent data

Data types

Categorical

No quantitative relation
No inherent order

Ordinal

Can be ordered
Degree of difference not measurable

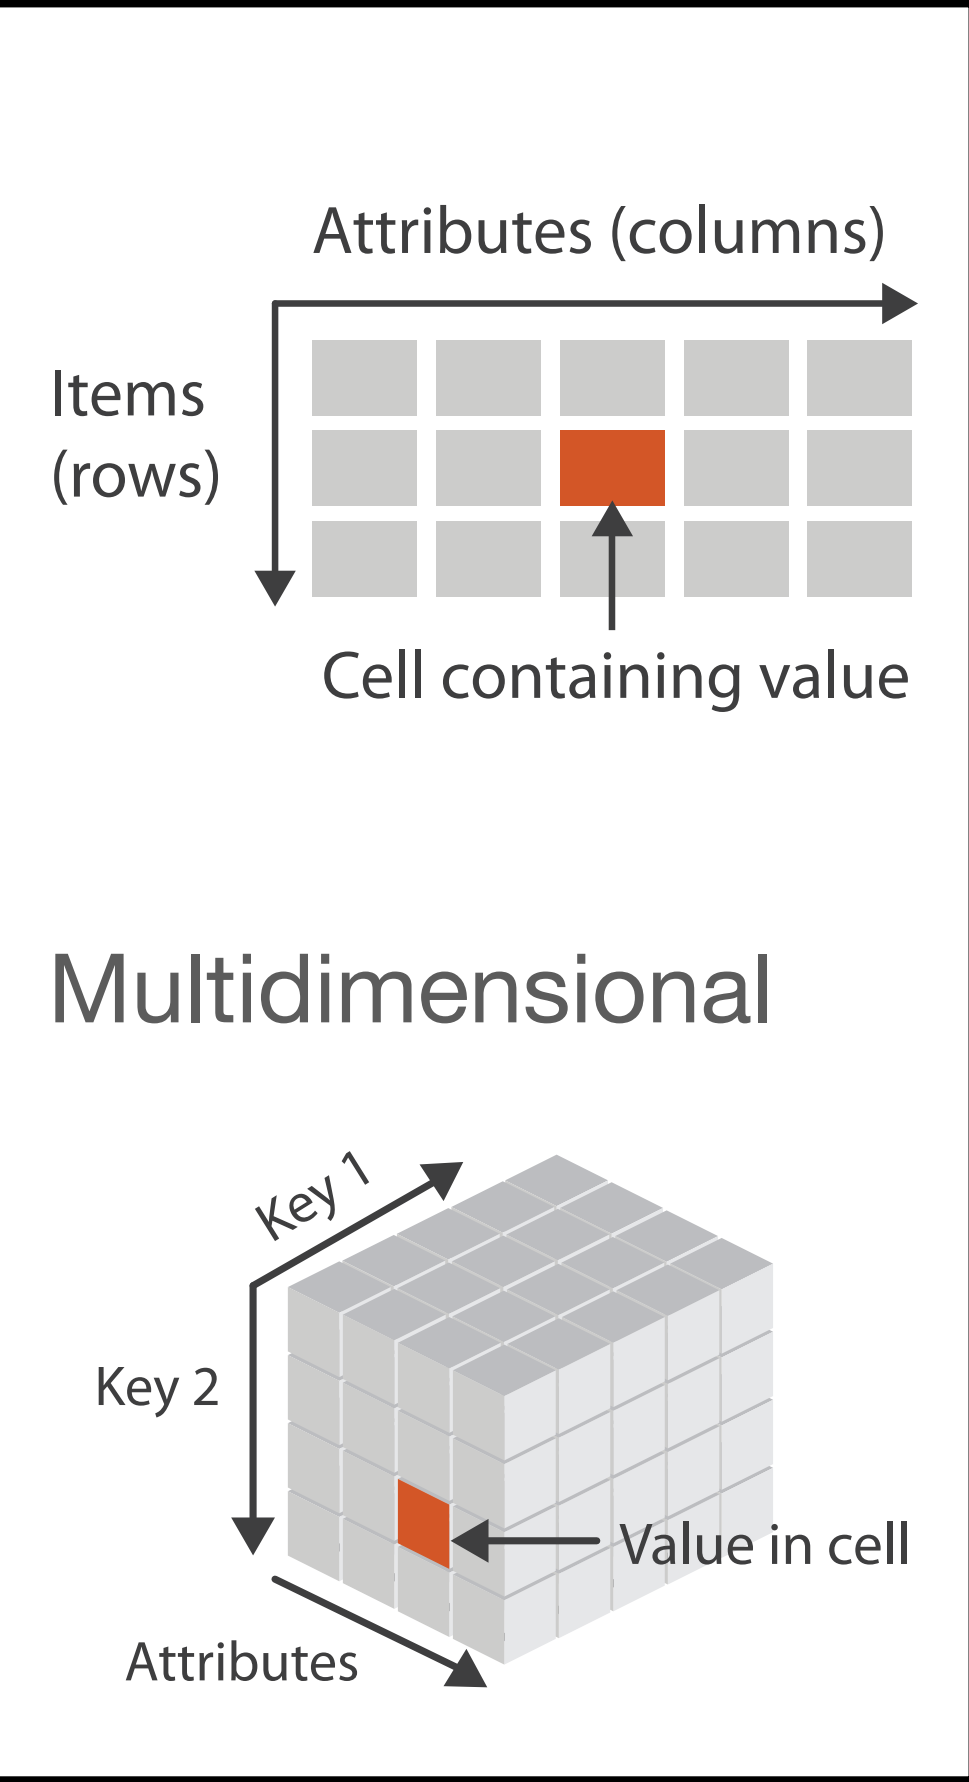

Quantitative

Can be measured
and manipulated numerically

Data types by structure

Tables

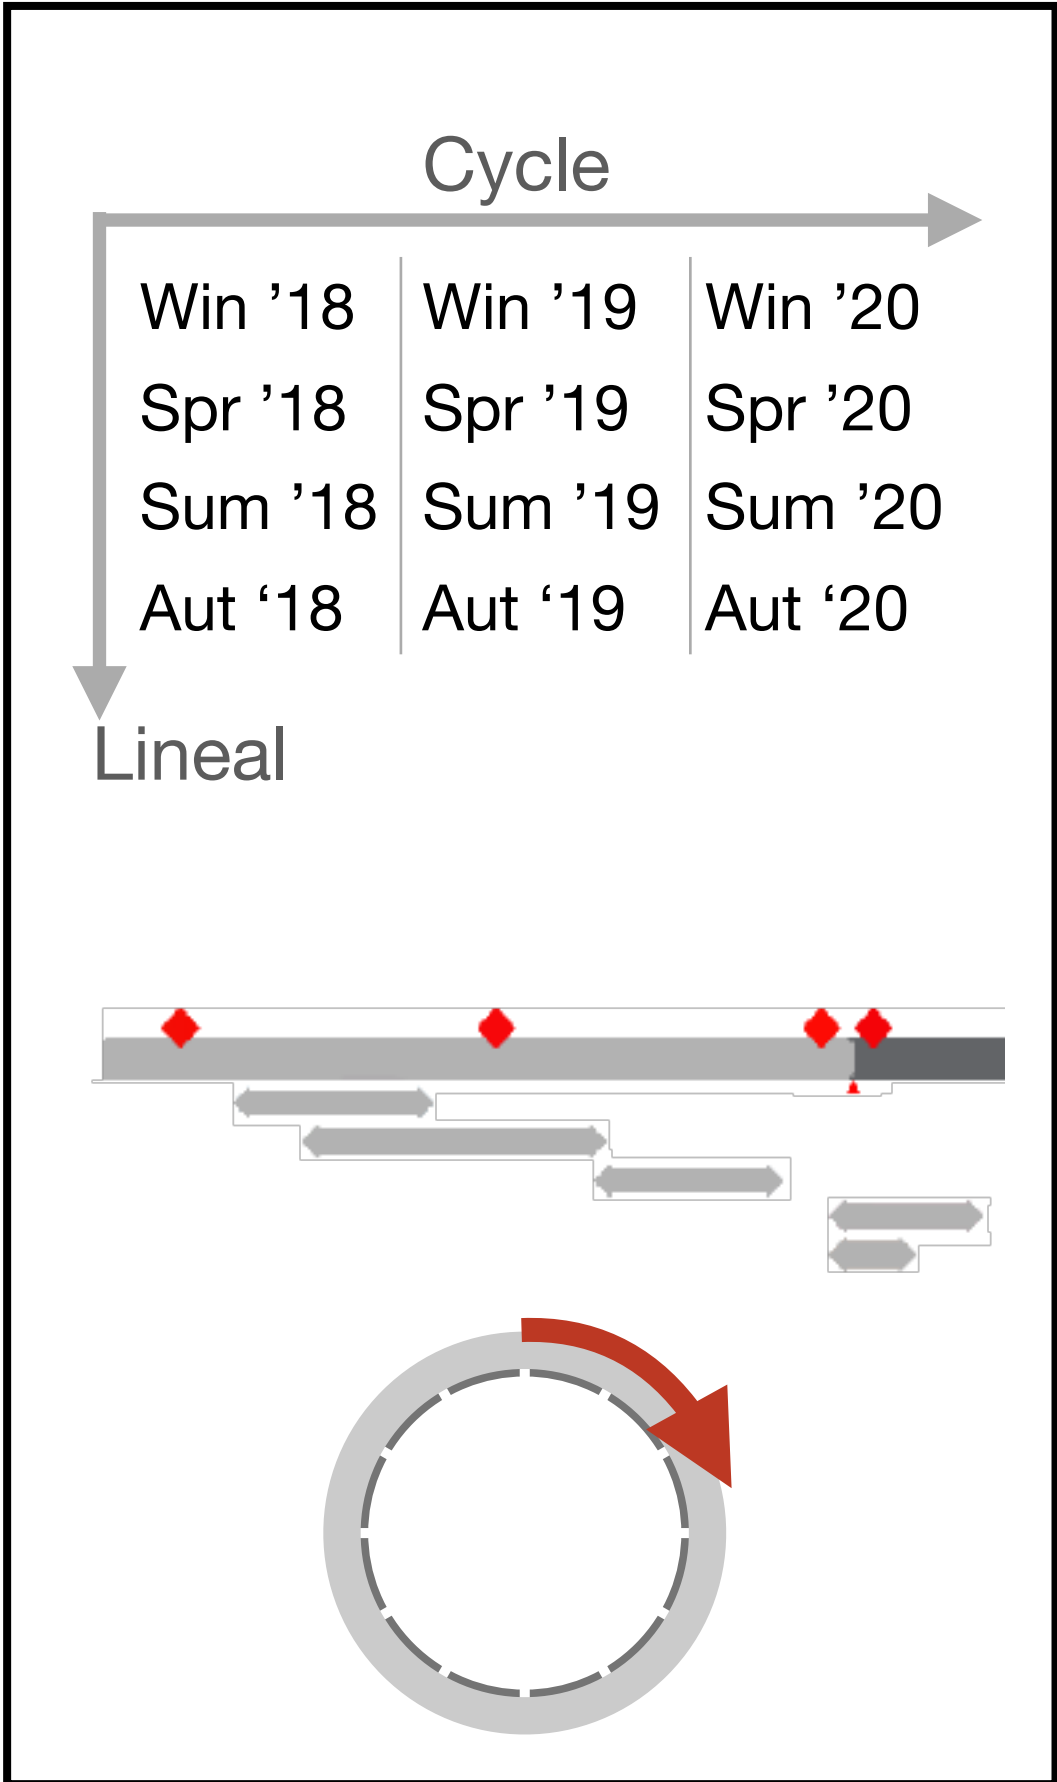

Relational

Spatial

Temporal

Spatio-Temporal

Textual

Visual Encoding

Represent data through visual channels

Draw 37 and 73

Position on common scale

Position on unaligned scale

Length (1D size)

Tilt/angle

Area (2D size)

Depth (3D position)

Color luminance

Color saturation

Curvature

Volume (3D size)

Visual Channels

Spatial region

Color hue

Motion

Shape

Visual Channels

The visual channel that we choose must permit the desired analysis and comparisons

Compare categorical values
Unrelated categories = different colours

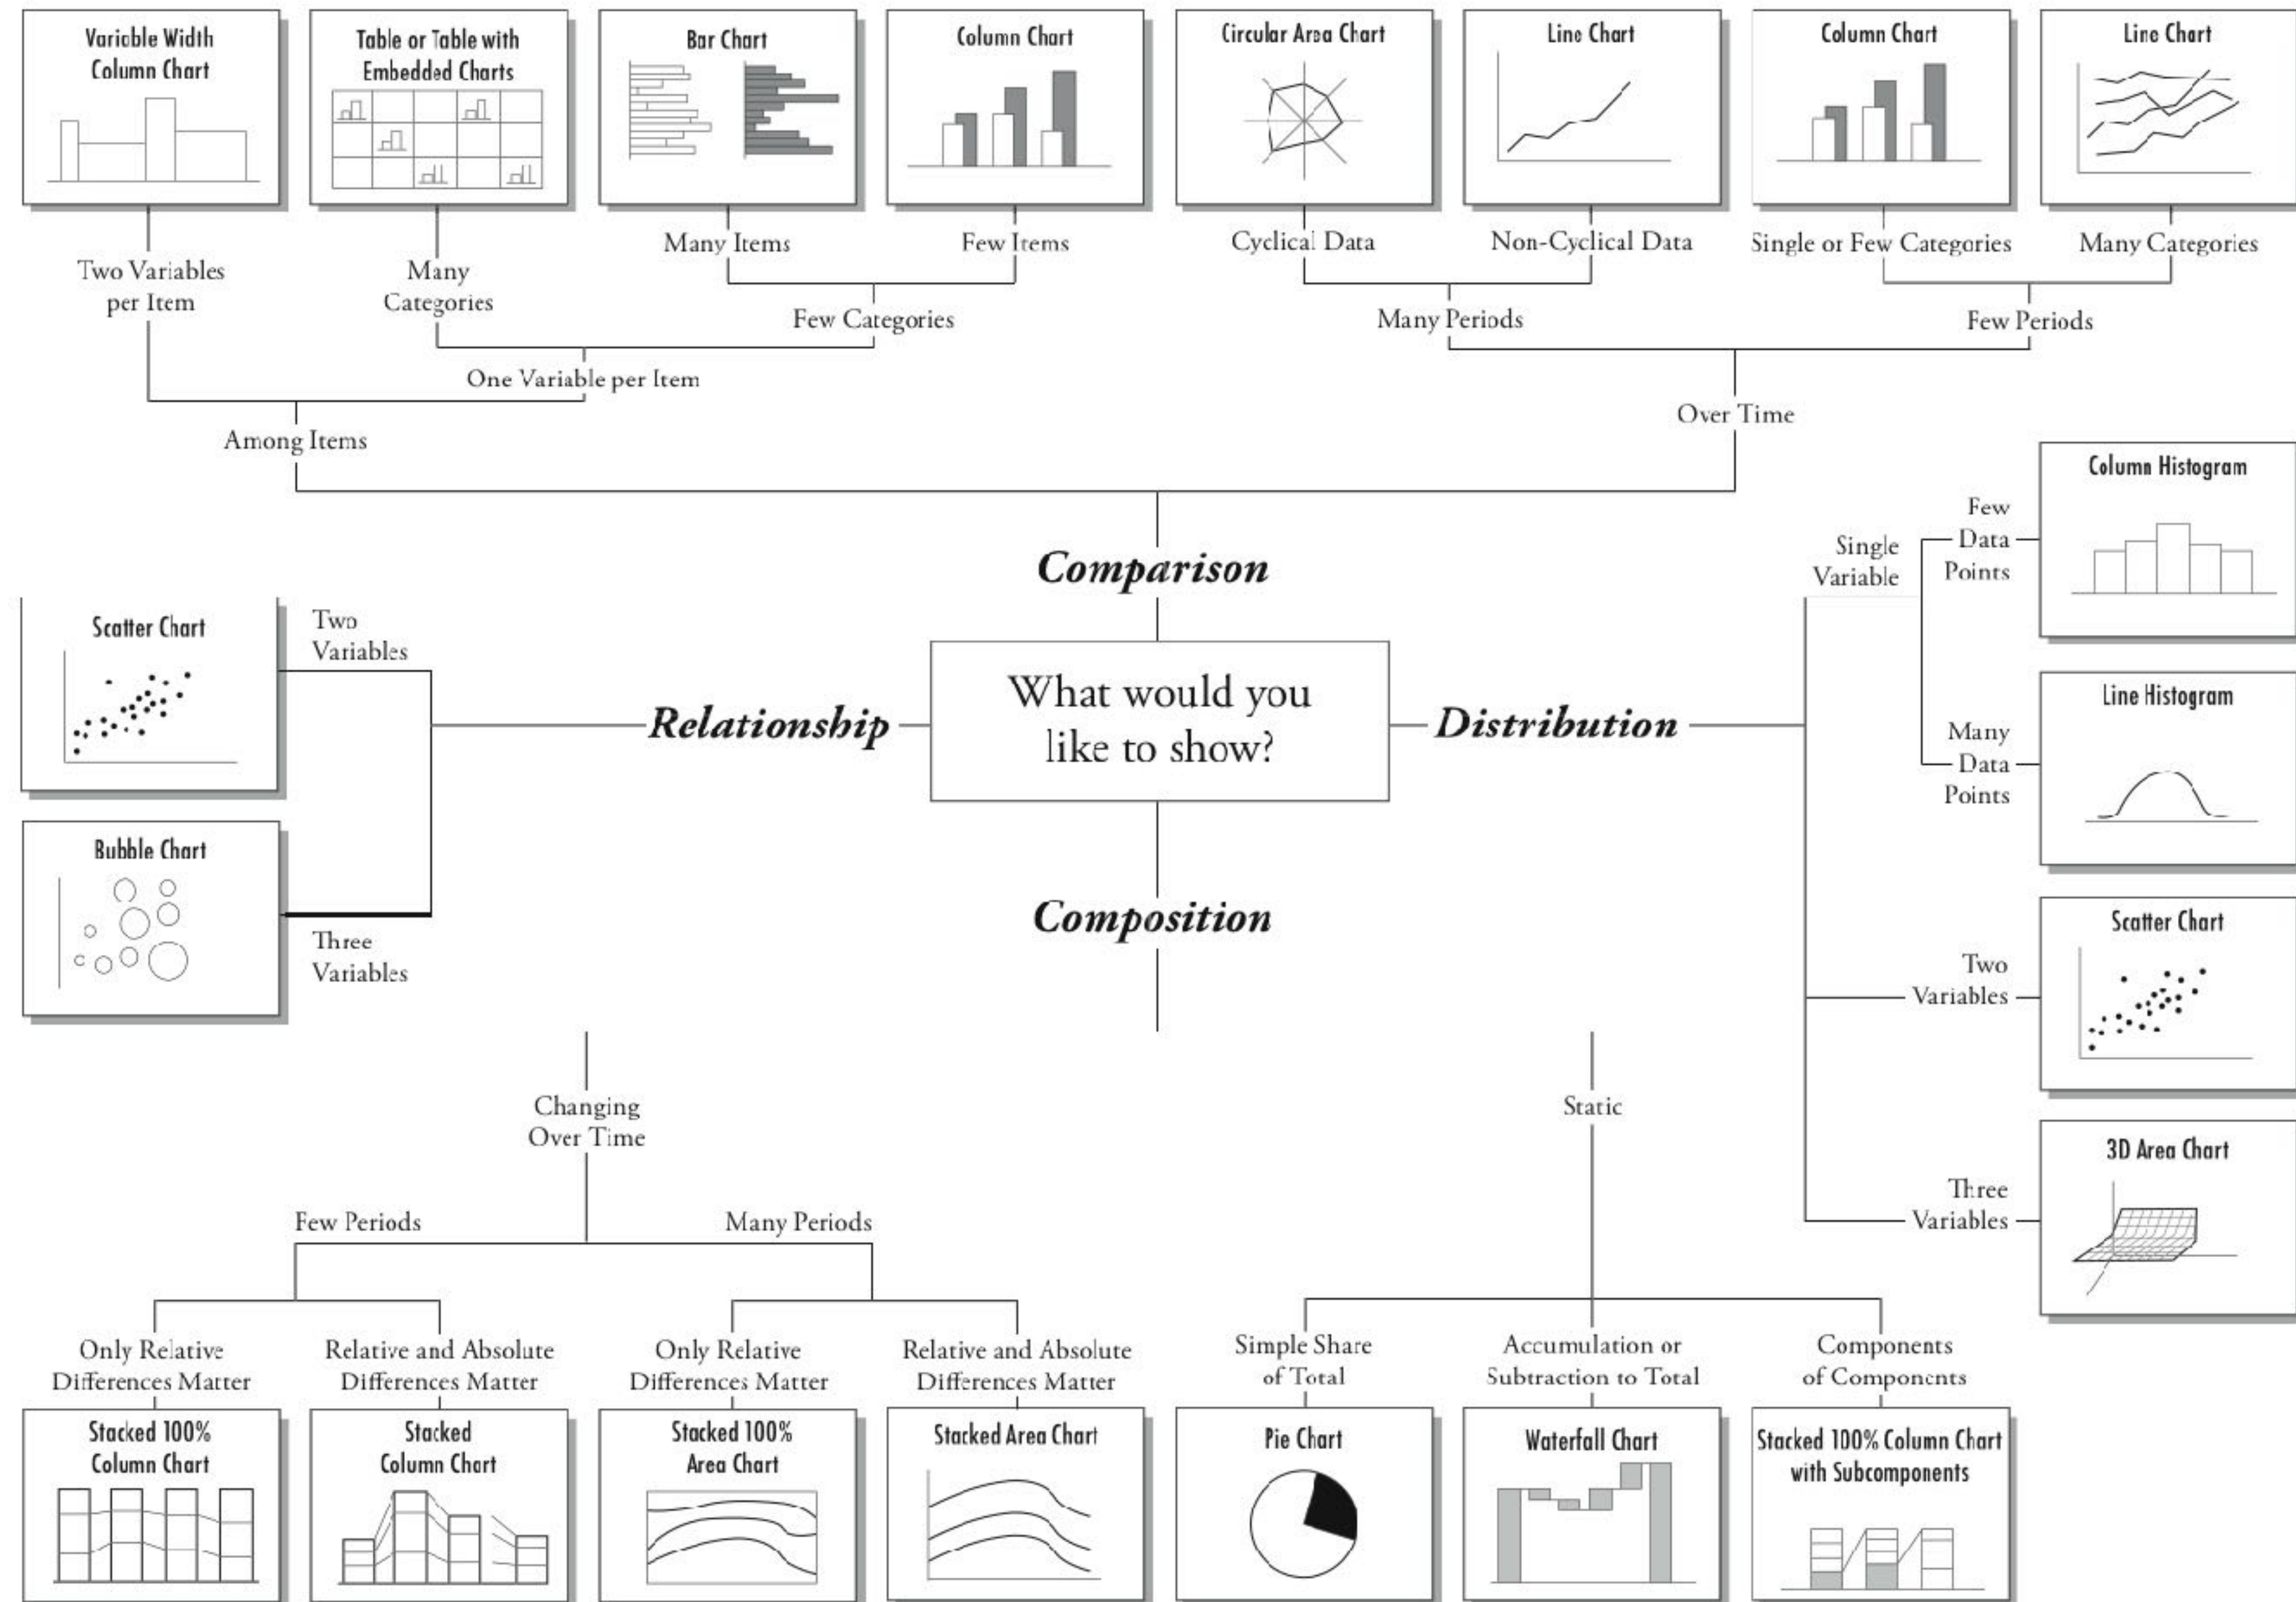

Progressive variation in data = in color

Charts

Chart Suggestions—A Thought-Starter

Types of charts

Scatter plot - Bubble chart - histogram

Gapminder

David Terr

Bars - Grouped bars - Bullet plot

Types of charts

Pie chart - stacked bars - Stream graph

Line chart - Difference chart - Fan chart

sean. @SeanMcElwee · 14 Dec 2015

.@NRO @powerlineUS no need to worry about the national debt then either!

467

1.7K

Average global temperature by year

Data from NASA/GISS.

The Washington Post

Energy production of a wind farm in kW. We are comparing values to each other, don't need to start at 0

Annual energy production

Tips to make good graphs

- Pay attention to the axis
- Add annotations
- Show your data
- Avoid chart junk

Be careful with default plot settings:
Put clear marks on the axis, understandable
text/data points, meaningful titles

Tips to make good graphs

- Pay attention to the axis
- Add annotations
- Show your data
- Avoid chart junk

Don't assume your audience knows your data
They don't!

State axis clearly, put titles and legends, color scale, highlight important events, etc.

Measles

Tips to make good graphs

- Pay attention to the axis
- Add annotations
- **Show your data**
- Avoid chart junk

Anscombe's quartet, different distributions with identical mean, median, and other summary statistics

The shape of the distribution can reveal more about the data

from Wikipedia

Porcentaje de voto según las encuestas. Las líneas representan un promedio ponderado por fecha, tamaño de muestra y empresa encuestadora.

Tips to make good graphs

- Pay attention to the axis
- Add annotations
- Show your data
- **Avoid chart junk**

Avoid over-charging your charts:

Less colours, transparent/neutral background, meaningful dimensions and annotations, unobtrusive legends, etc.

For the objective of comparing trends, split in multiple linecharts work better than one

Visual precision

Choice of axes: highlight trend or variation

Don't cut the Y-axis in percentages

Percentage of victories

WRONG

Percentage of victories

RIGHT

<http://news.nationalgeographic.com/2015/06/150619-data-points-five-ways-to-lie-with-charts/>

Be careful with double axes - False perception of equivalence

Uncertainty visualisation

Error bars considered harmful. Correll M., Gleicher M.

Uncertainty visualisation

Nikki Marinsek

Choose the right plot and avoid distorting the data

Now what?

Graphic Design

A quick word on **design**

Not just about aesthetics

Not just about aesthetics

It has to work!

Not just about aesthetics

It has to work!

Active Vision

- Graphic designs are cognitive tools that facilitate insight
- Vision and cognition are tightly related
- Puts human perception at the center of design:
Design with the mind in mind

How many passes does the team in white make?

Visual perception

- We don't see the world as it is, our mind processes the information
- Some mechanisms occur in a “pre-conscious” way
- Some actions are learnt, some others not

Encuentra el punto rojo

Visual Perception

The mind tricks

- Pop-out effect
- Gestalt principles
- Salience/Contrast

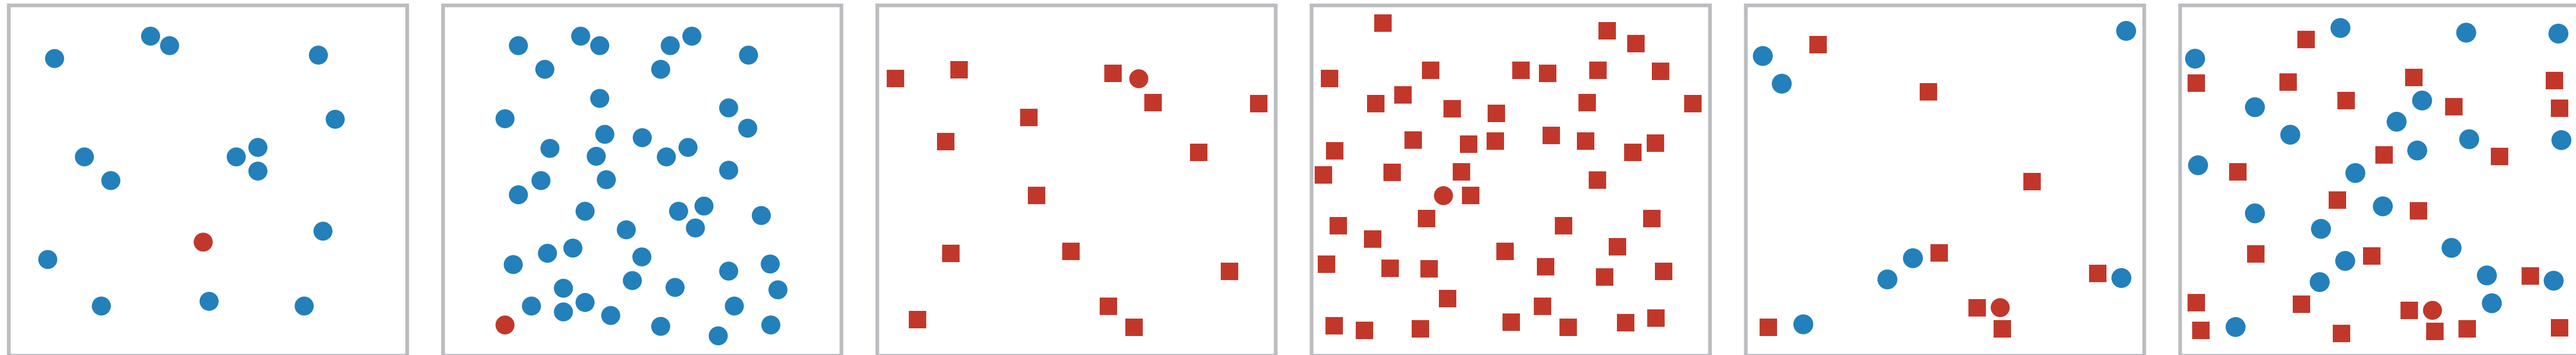

Pop-out

Low level of visual perception = Early stage of processing = Very fast processing

Pop-out

Speed detection in some channels is independent of distractor count

In other channels, speed depends on the amount of distractors

In mixed channels speed depends on both channel and amount of distractors.

Primary visual cortex can be tuned for circles or red things, not both

Color scales

Match color to data

Match color to data

Sequential

Divergent

Categorical

Sequential

Discrete

Continuous

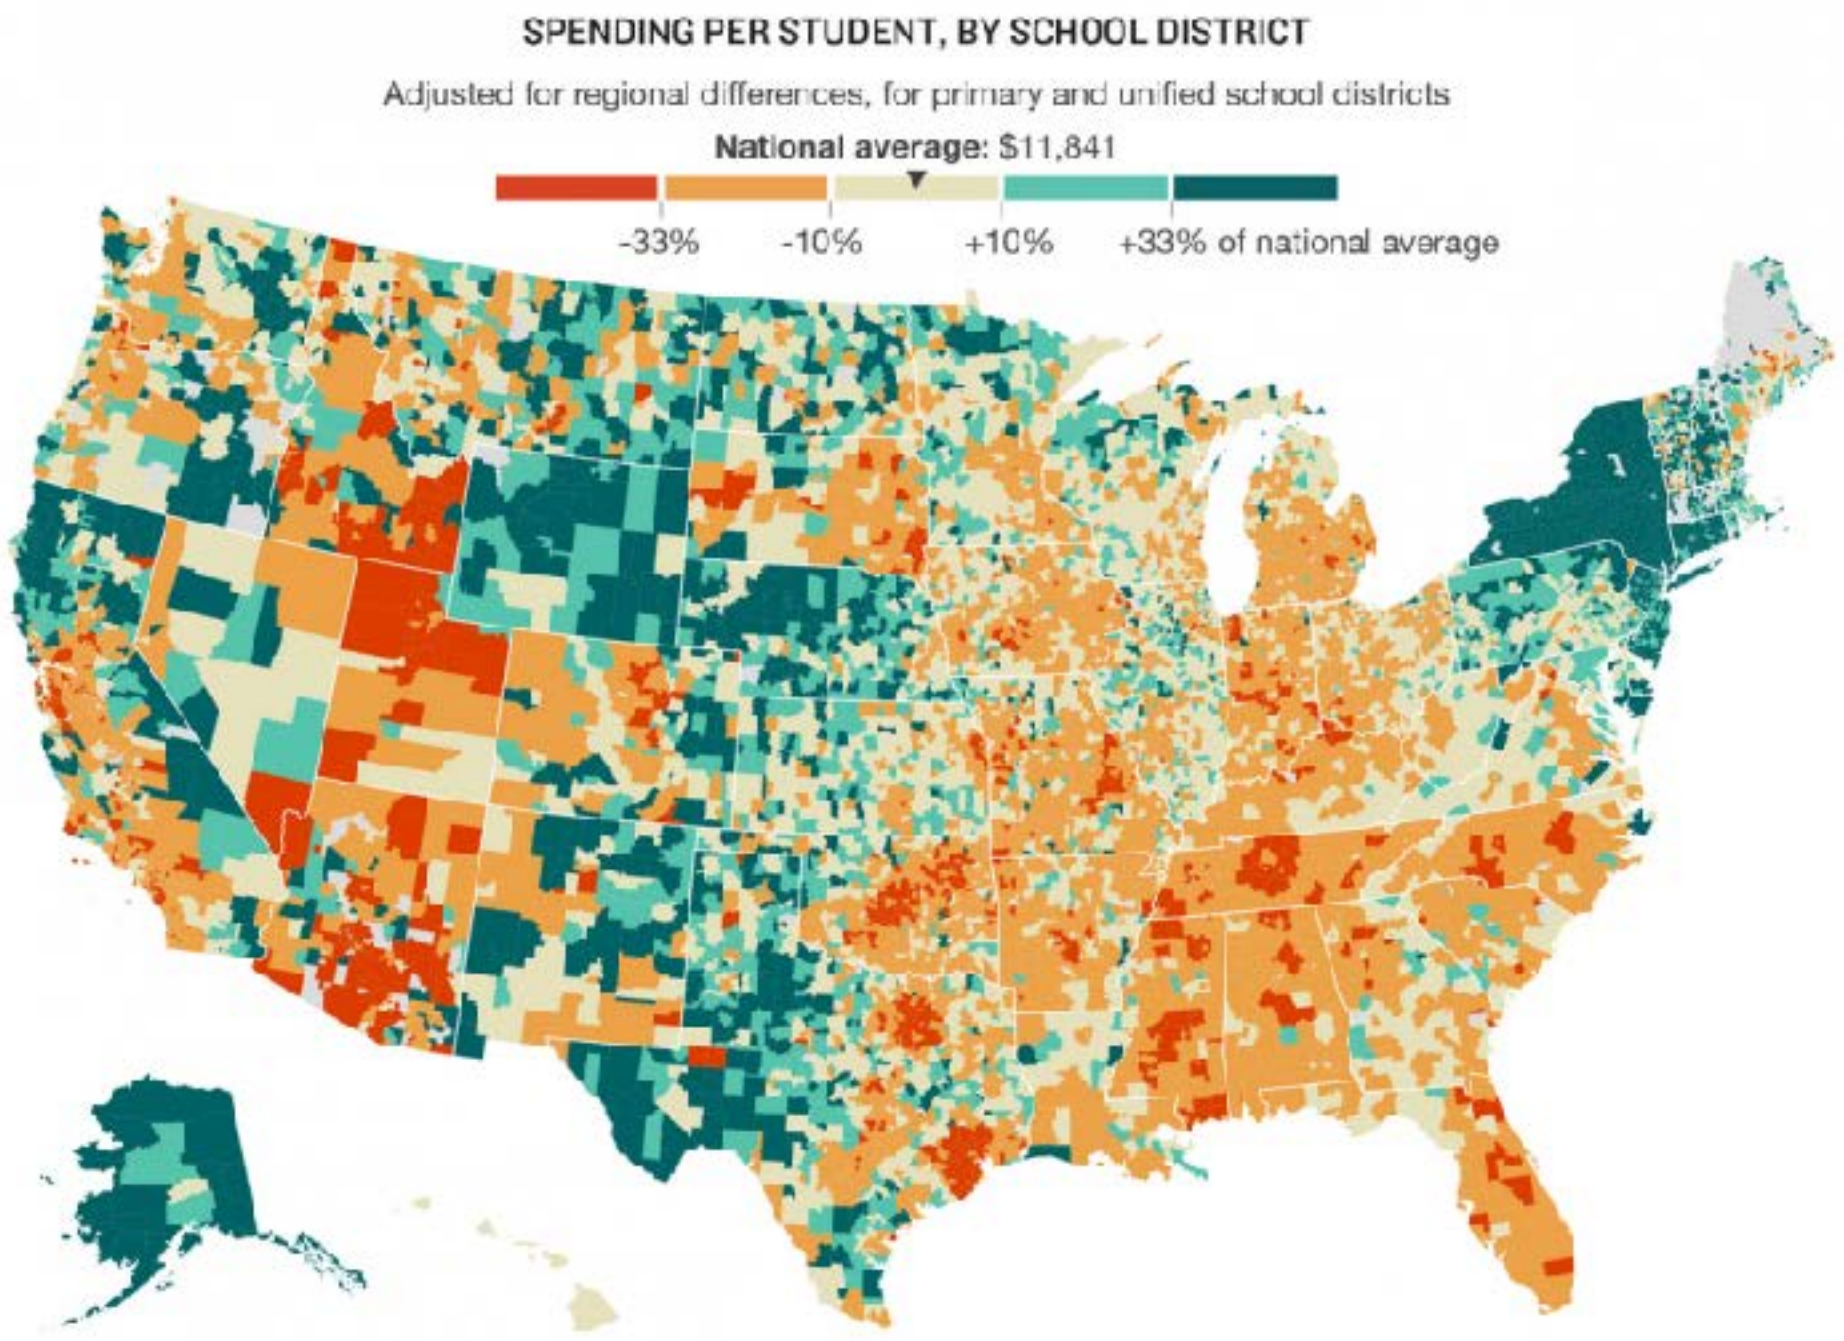

Ordinal

Divergent

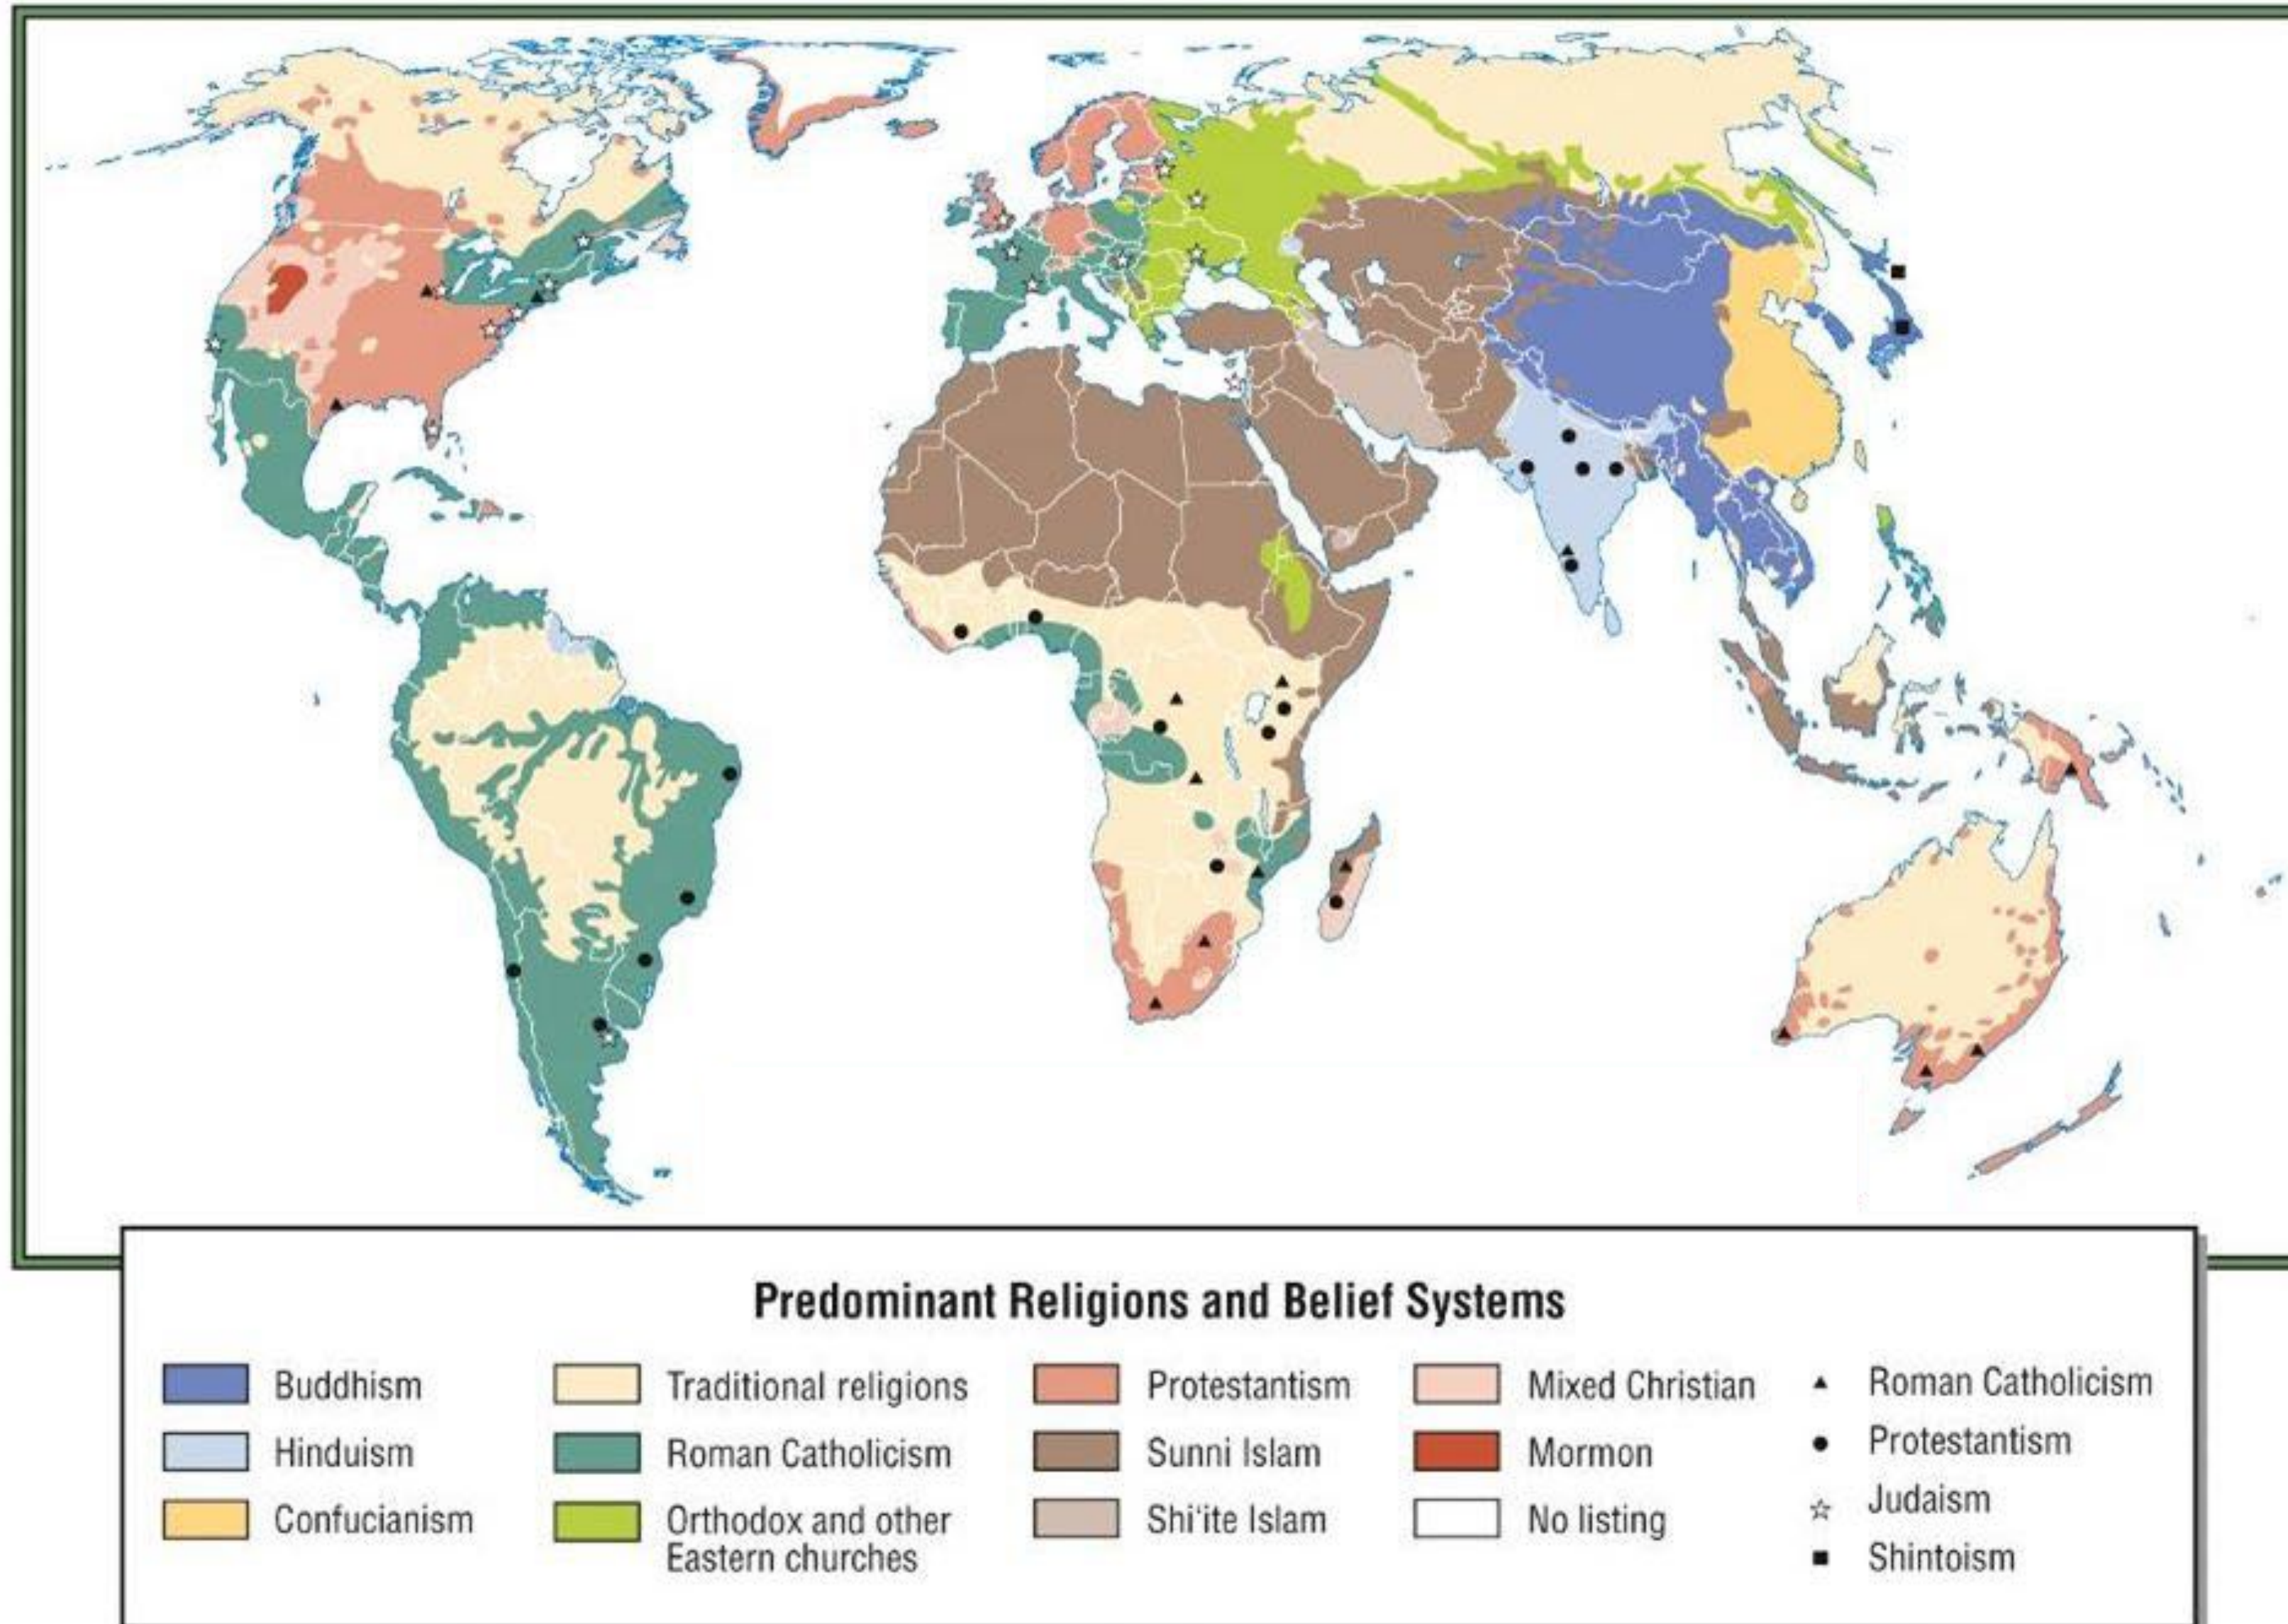

Non-symmetric divergent orange-white-purple palette

Categorical

No more than 12 colors

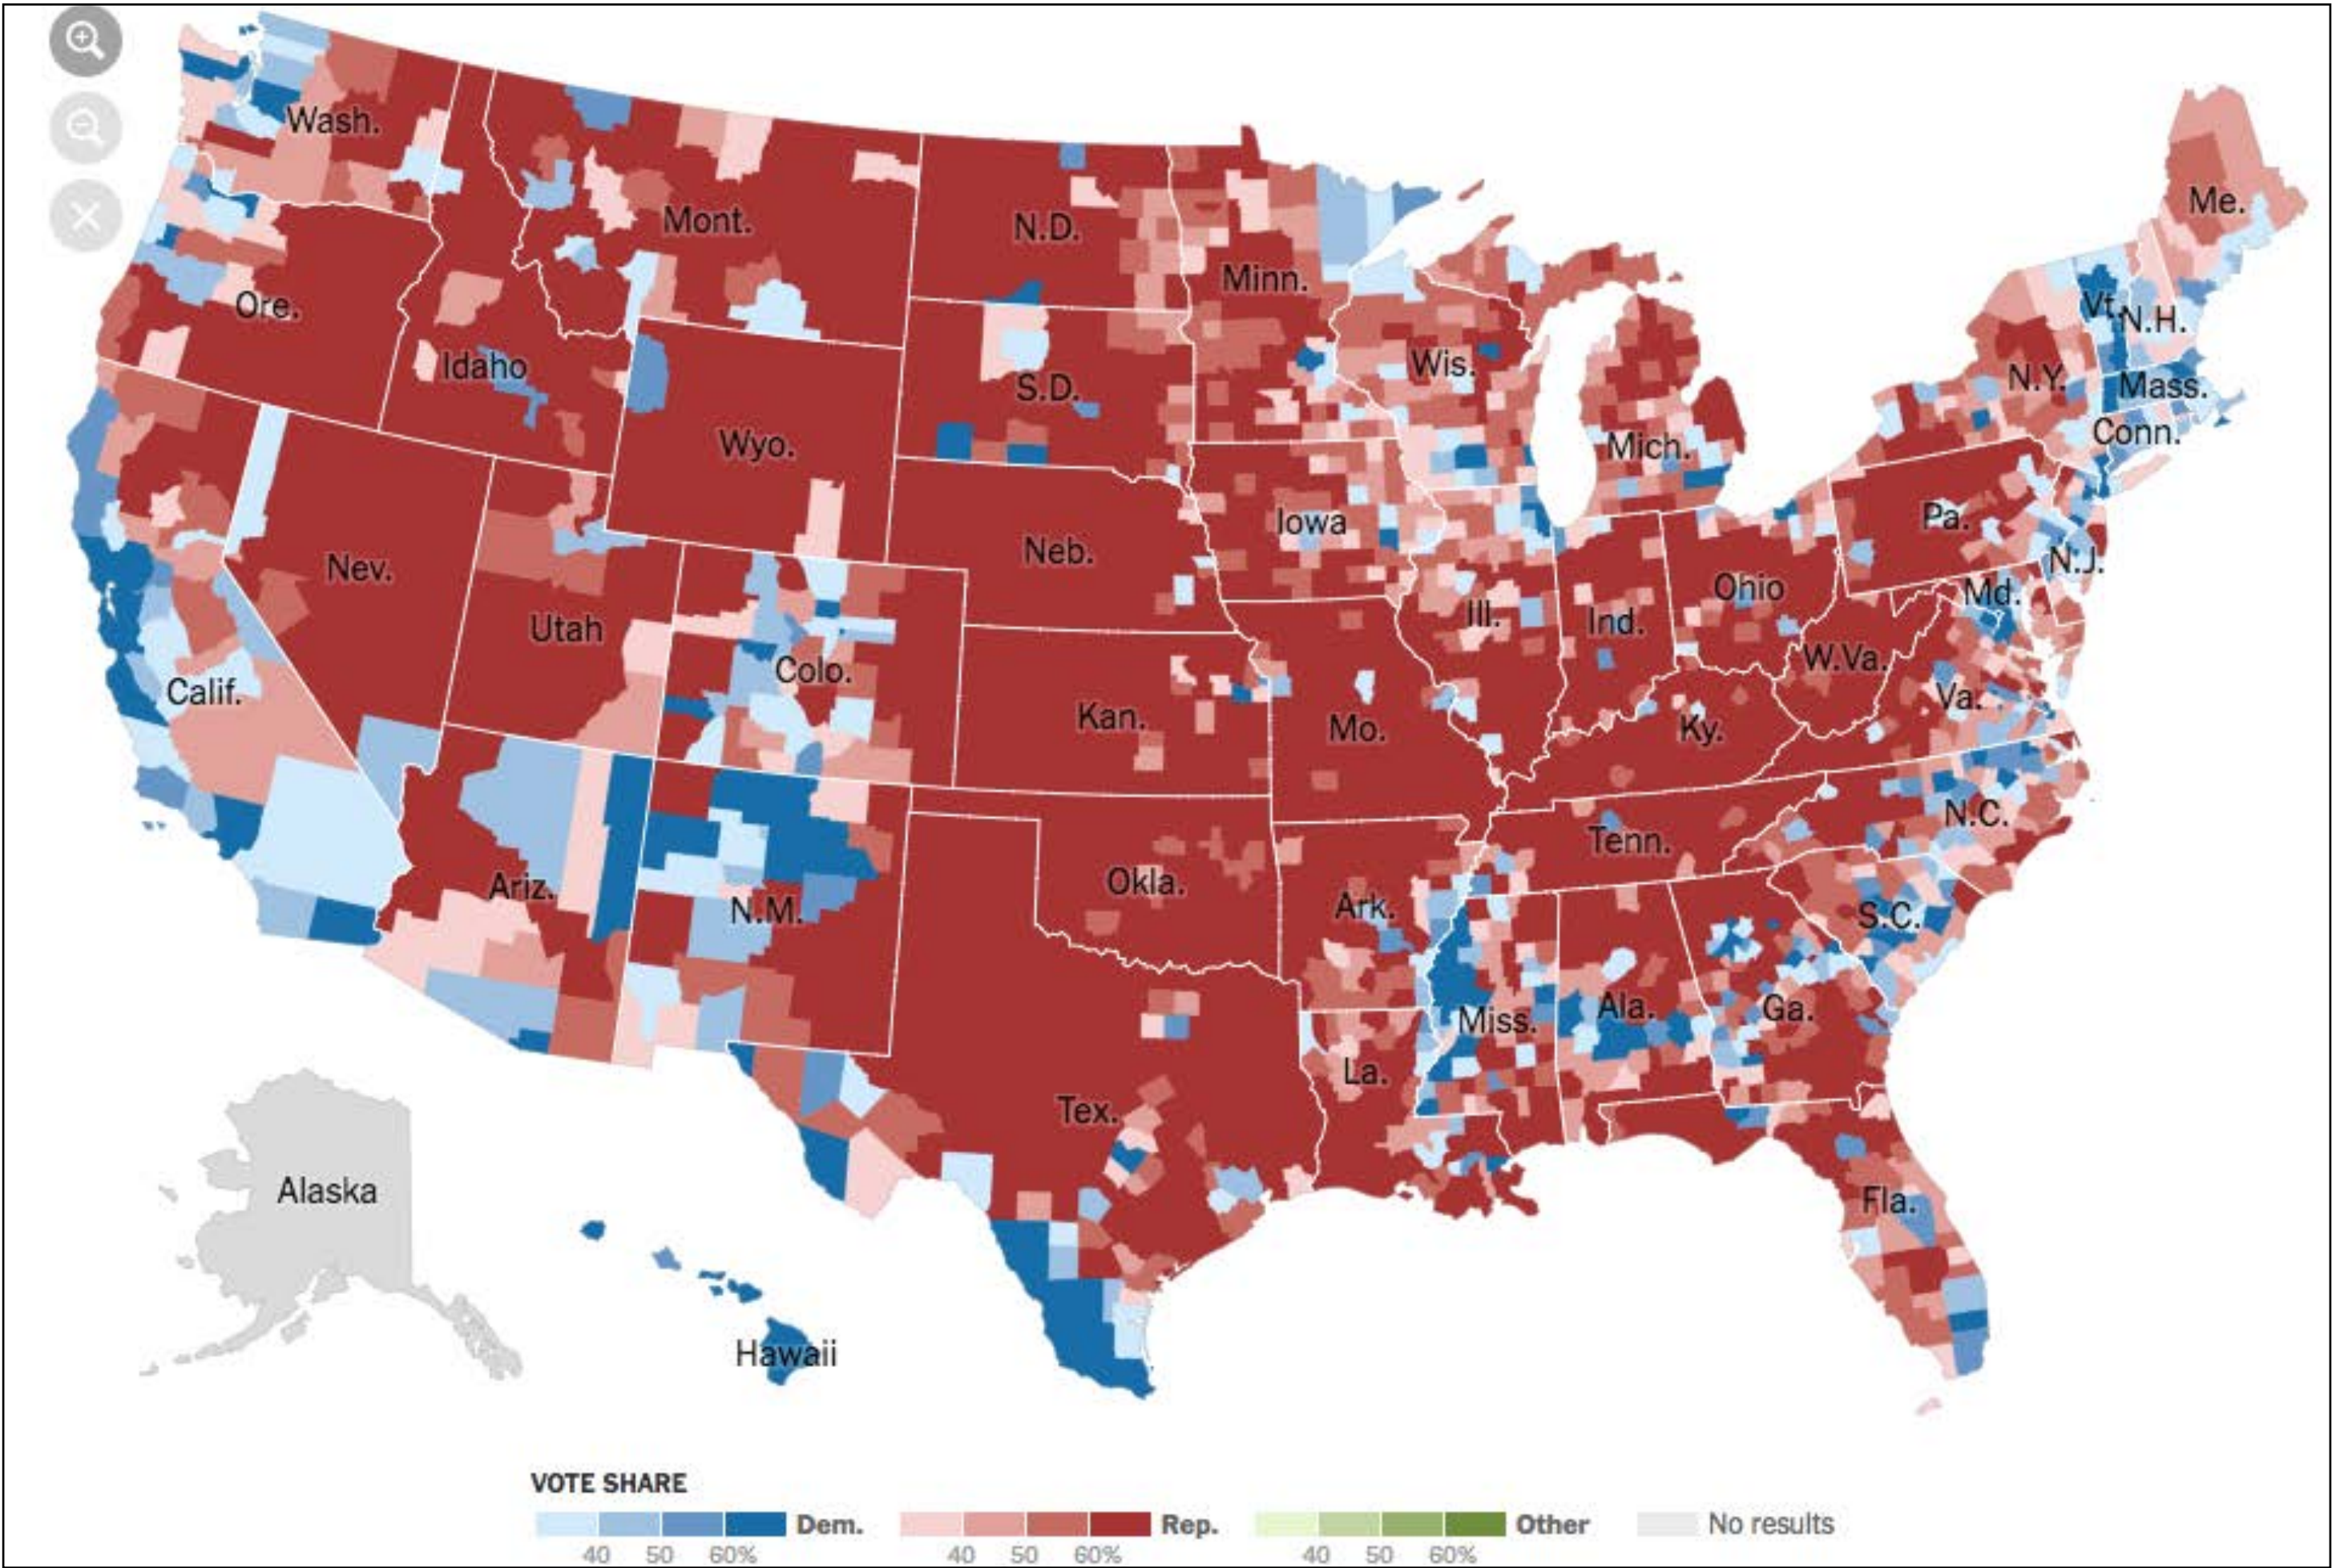

Categorical

Beware of continuous gradients, can be confused with ordinal
Better use big differences in hue, sat, and/or luminosity

Grouped

Grouped color scheme of 4 categories (4 hues) with 4 steps of saturation and lightness each

The rainbow color scale

The rainbow color scale

- We see some colours brighter than others
- Interpolations are not perceptually linear
- No continuous variation in lightness
- No inherent meaning

Not made for humans

Don't use it

The wrong color scale can show effects that are not present in the data

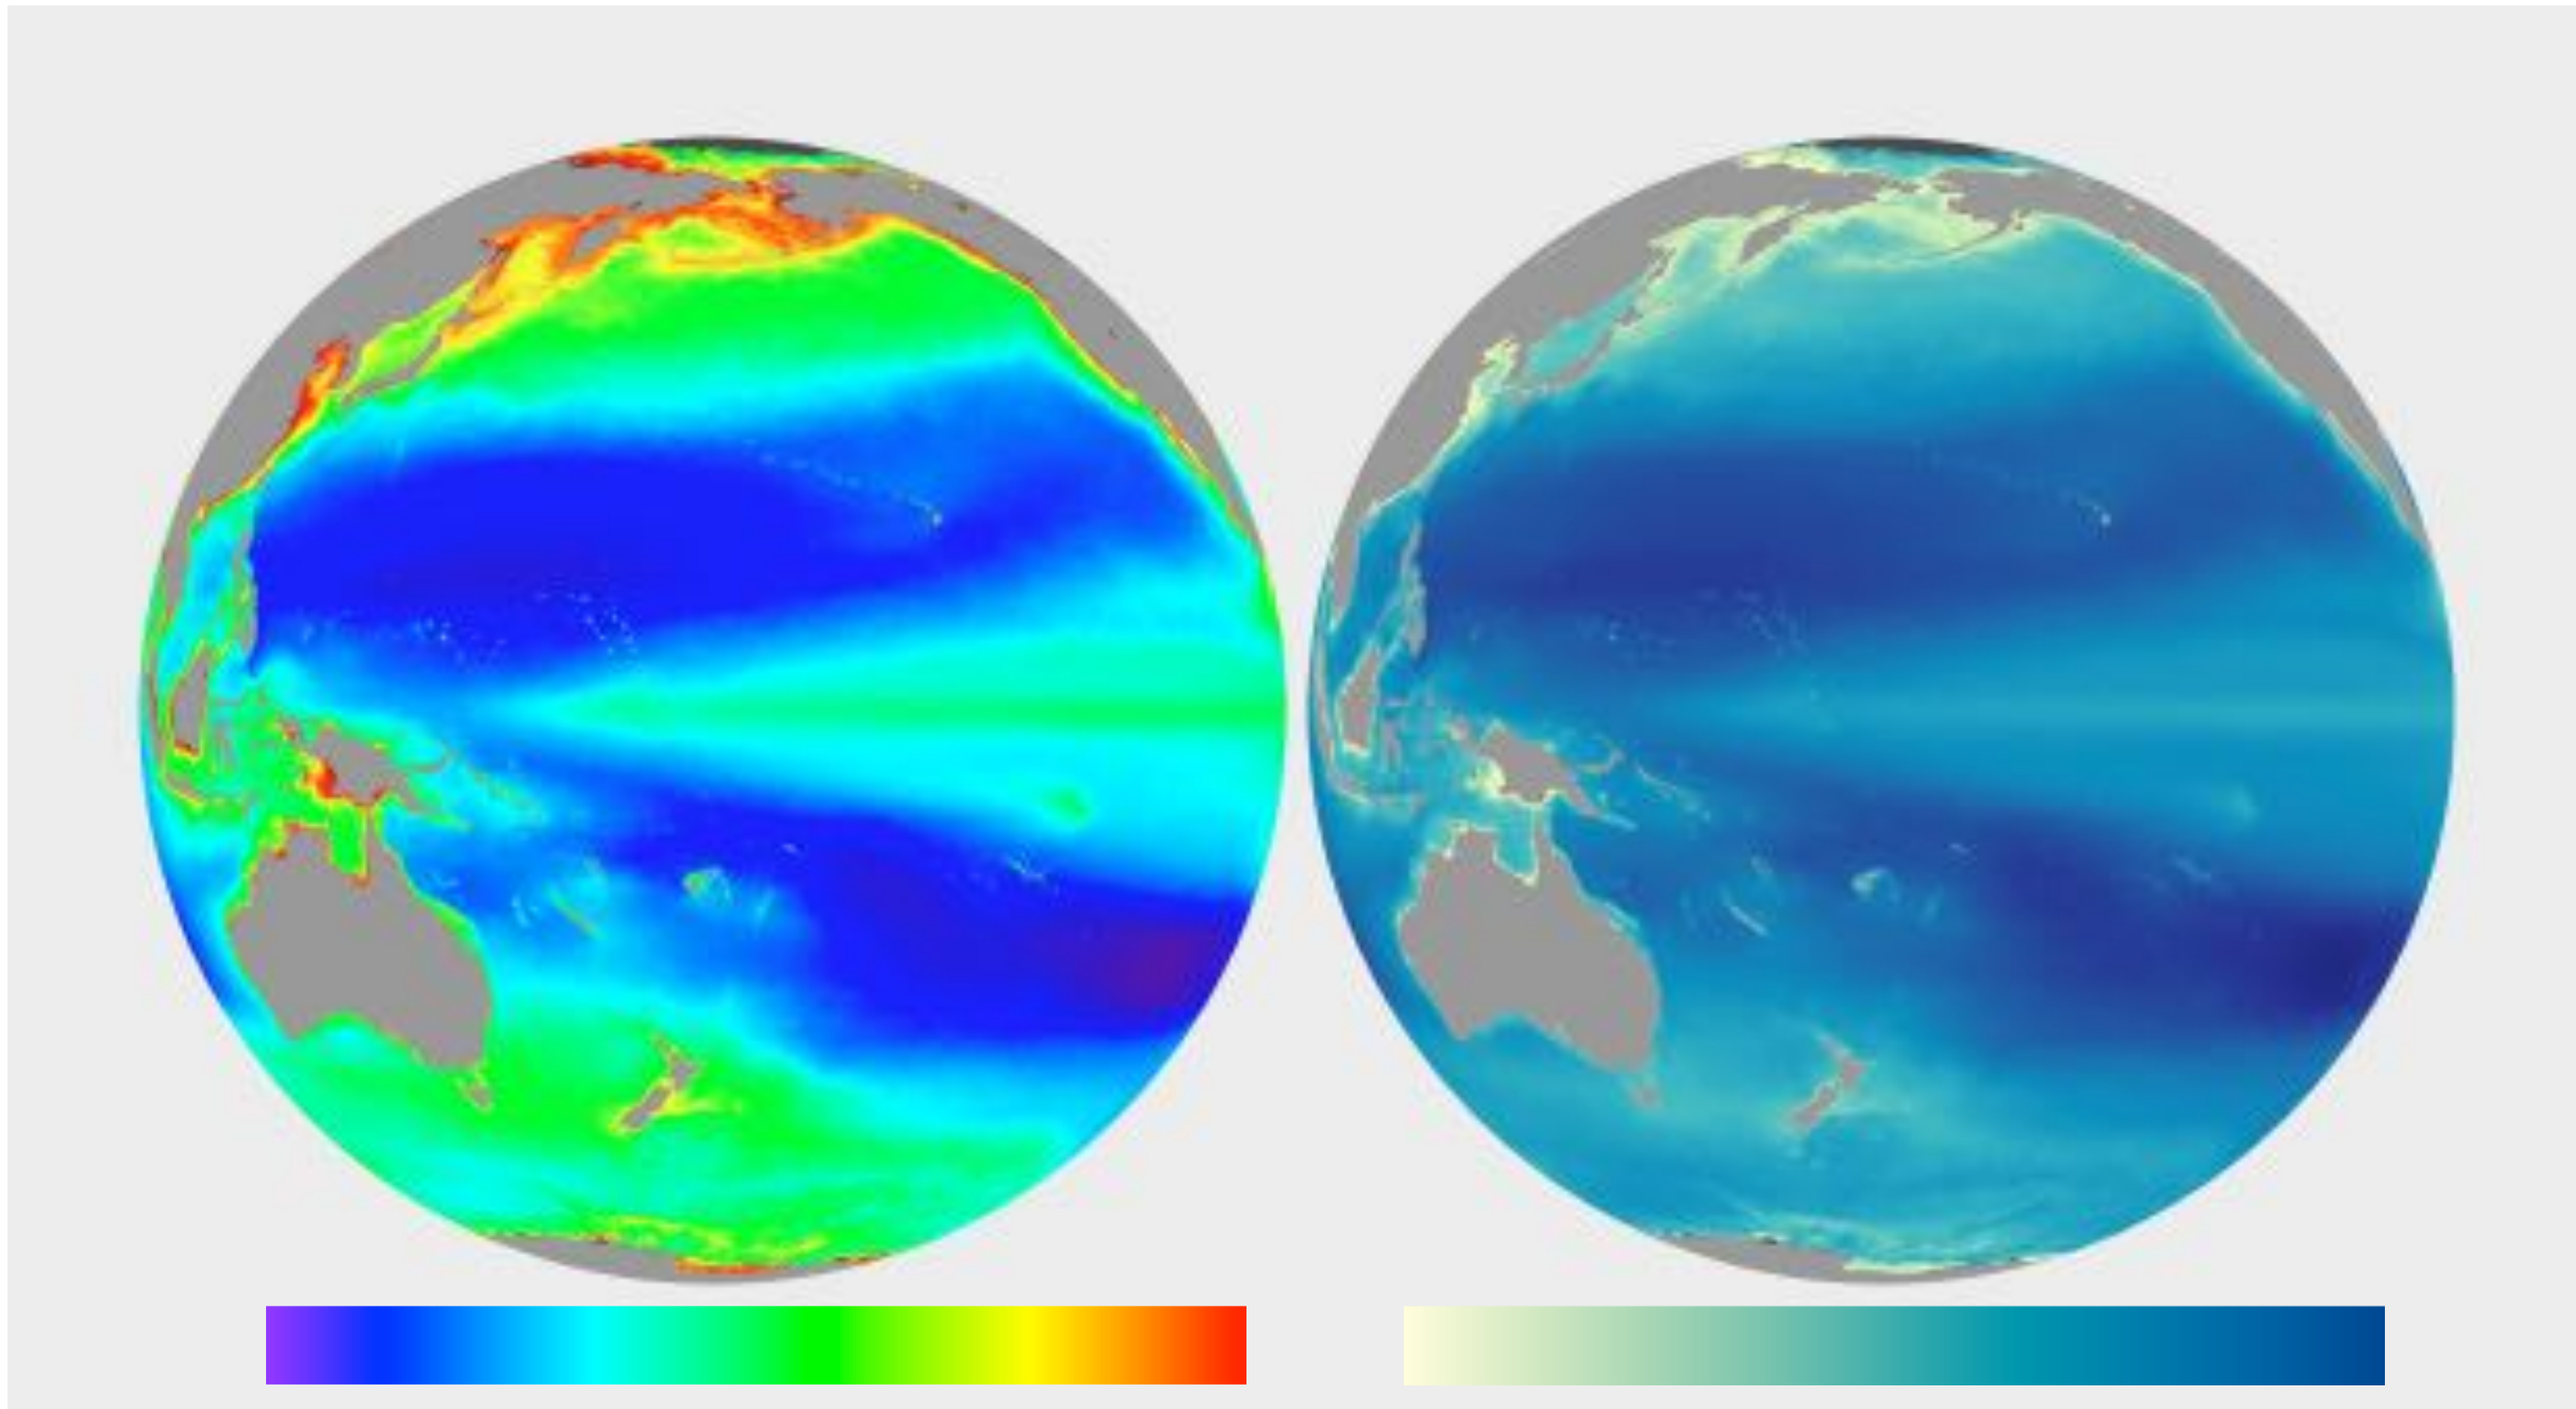

Sean Davis, NOAA

Perceptually linear scales

Use scales with an even variation.

Scales that show contrast and change when there is change in the data and not because of optic distortions

Perceptually linear scales

A good color scale should vary consistently across the range of values

<https://cran.r-project.org/web/packages/viridis/vignettes/intro-to-viridis.html>

Color deficiency

Non-symmetric divergent orange-white-purple palette

Deuteranope

Symmetric divergent orange-white-purple palette

Protanope

Symmetric divergent orange-white-purple palette

Tritanope

Symmetric divergent orange-white-purple palette

[Seriously Colorful: Advanced Color Principles & Practices. Stone.Tableau Customer Conference 2014.]

Semantics of color

Some advices

- Contrast is necessary to show detail
- Use perceptually linear scales
- Don't use a rainbow color scale
- Match data type with the correct scale
- Colour deficiency and people who print papers
- Never use a rainbow color scale
- Make missing data recognisable
- Connect colour to meaning

Line spacing

The distance from the baseline of one line of type to another is called *line spacing*. It is also called *leading*, in reference to the strips of lead used to separate lines of metal type. The default setting in most layout and imaging software is 120 percent of the type size. Thus 10-pt type is set with 12 pts of line spacing. Designers play with line spacing in order to create distinctive layouts. Reducing the standard distance creates a denser typographic color—while risking collisions between ascenders and descenders.

Make the right chart

Design

Original plots

- Simulation of the wind to calculate energy production in a real wind farm
- Comparison of simulation results (green) vs. on-site measurements (red)
- Annual average of each individual windmill (N=132)
- Dataset has Power (kW), ID, array ID, and location

Additional Data

- 3D Simulation of the wind velocity over complex terrain geometry
- Usually shown as 2D cuts at the centre of the blades

<https://www.energy.gov/eere>

Barcelona Supercomputing Center

Original plot

A basic checklist

Who is the audience? Project partners in energy company

How will it be used? Presentation of results/dissemination poster

What is the goal? Compare results vs. measurements
Assess the accuracy of the model

What is the challenge? Stress the differences between values and
clarify what is represented on each axis

Difference Chart

A.K.A. Bivariate Area Charts

Displays two lines and the area between them.

Different colour for positive and negative difference

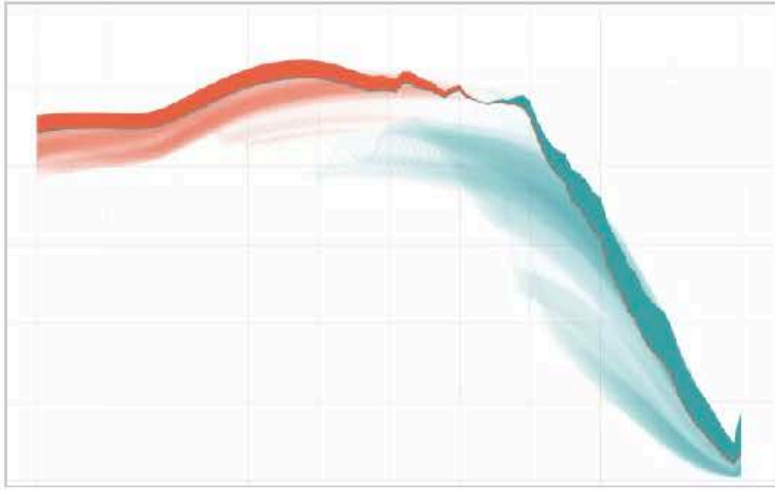

Mostly used for continuous data, usually time series

Membership Courses Tutorials GuidesBecome a Member | Log in

Difference Chart

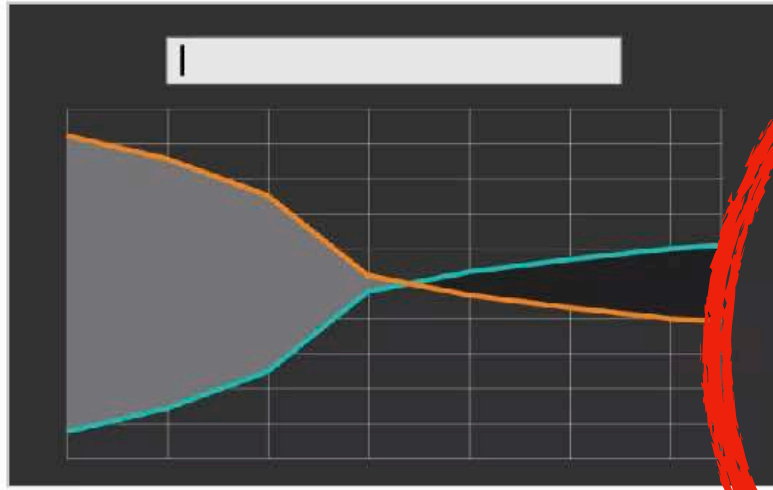

Fill the space between lines to highlight the greater-than and less-than differences over time.

Tutorials and Guides

How I Made That: Animated Difference Charts in R

A combination of a bivariate area chart, animation, and a population pyramid, with a sprinkling of detail and annotation.

How I Made That: Searchable Time Series Chart

When there are too many options or categories, it can be helpful to make the data searchable.

How to Make Bivariate Area Charts in R

Quickly compare two time series variables with this line-area chart hybrid that originated in the 1990s. Also known as: difference chart.

<https://flowingdata.com/charttype/difference-chart/>

First prototype: Fake difference chart with separated data points

- Hand made in Adobe Illustrator
- Test different colour schemes, avoid “traffic light” colors
- Break the perceived continuity of the standard line chart

Second prototype: Real data in Tableau Public and export to Illustrator

- Choose your tool
- Re-adjust colours (dots darker than lines)
- **Export SVG** to design software
- Add annotations, create legend box, tweak axes. Any task not conditioned by the number of elements

Second prototype: Real data in Tableau Public

What is the challenge?

Stress the differences between values and clarify what is represented on each axis

A continuous axis does not work for turbine number: associated to continuous data

Witness point location

- Link both plots to get rid of X axis
- Break continuity while still allowing to compare differences
- Exploring the relation between physical location and power generation can give further insight

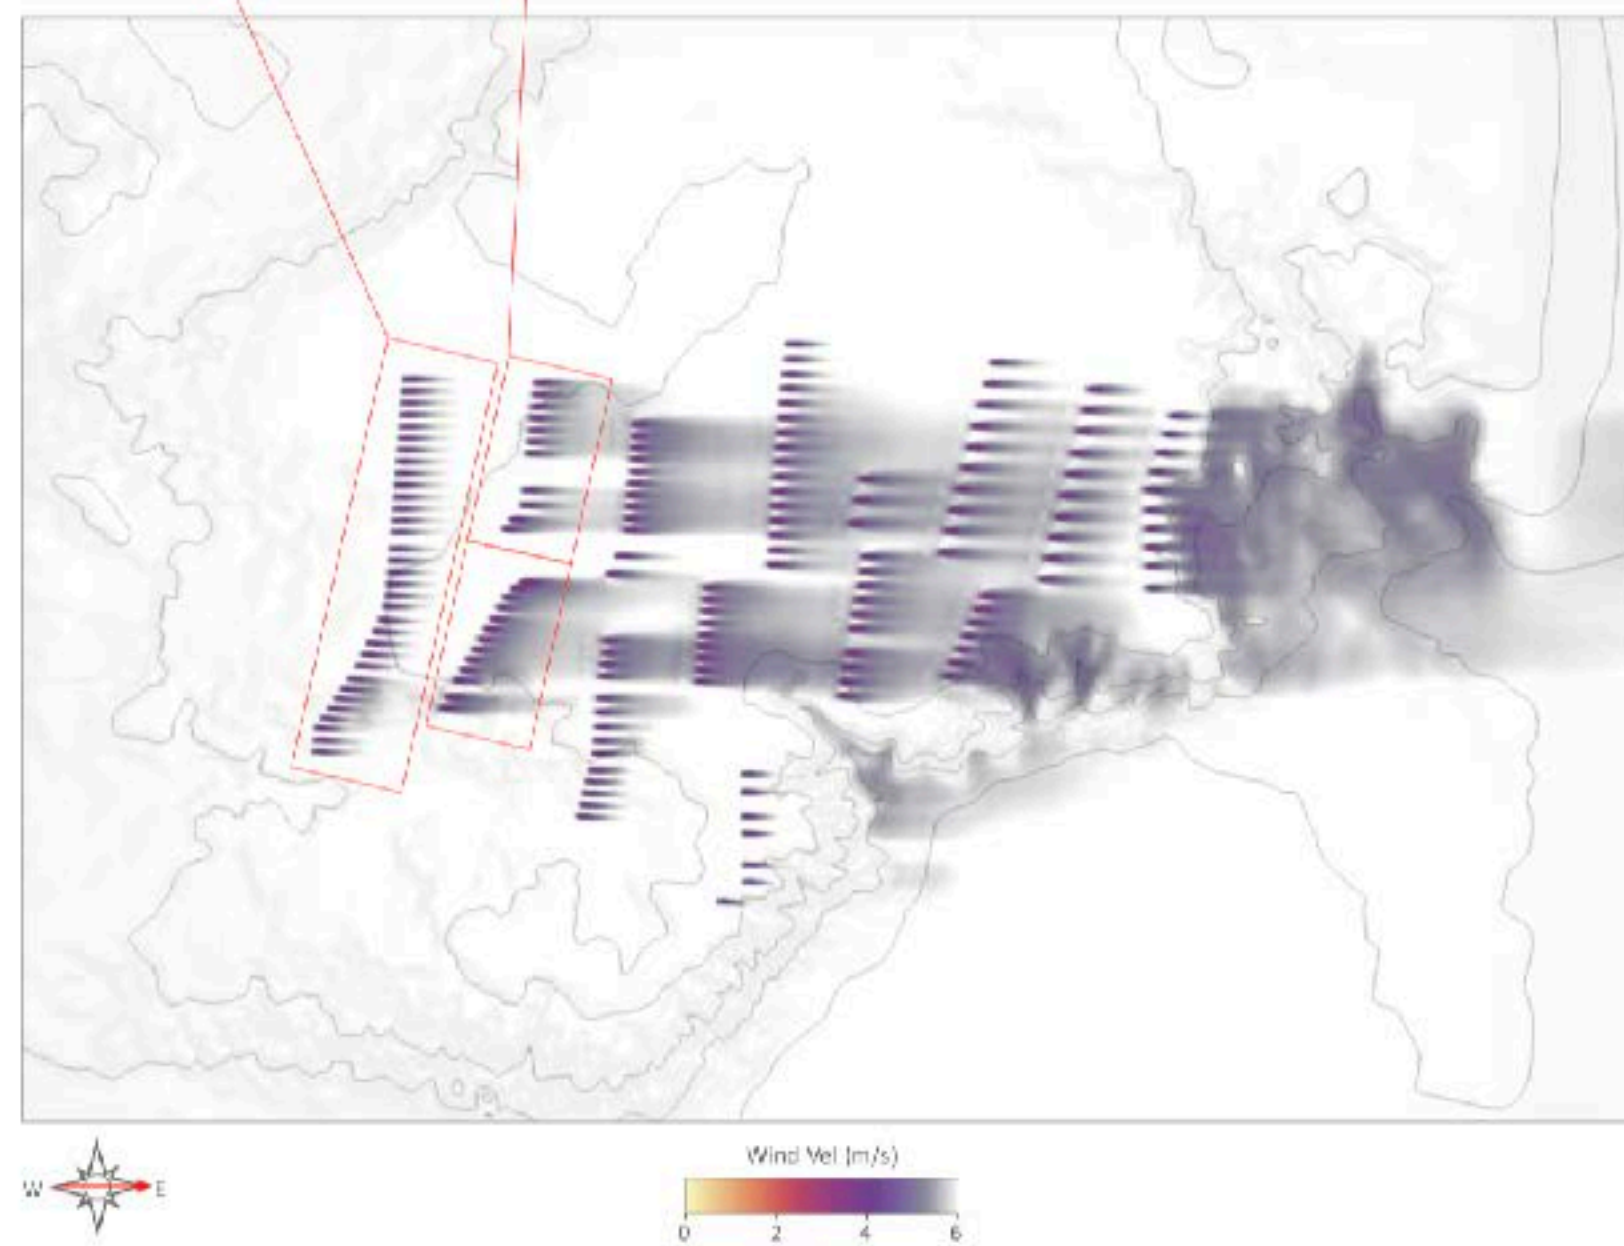

Original from Paraview (Sci-Viz software)

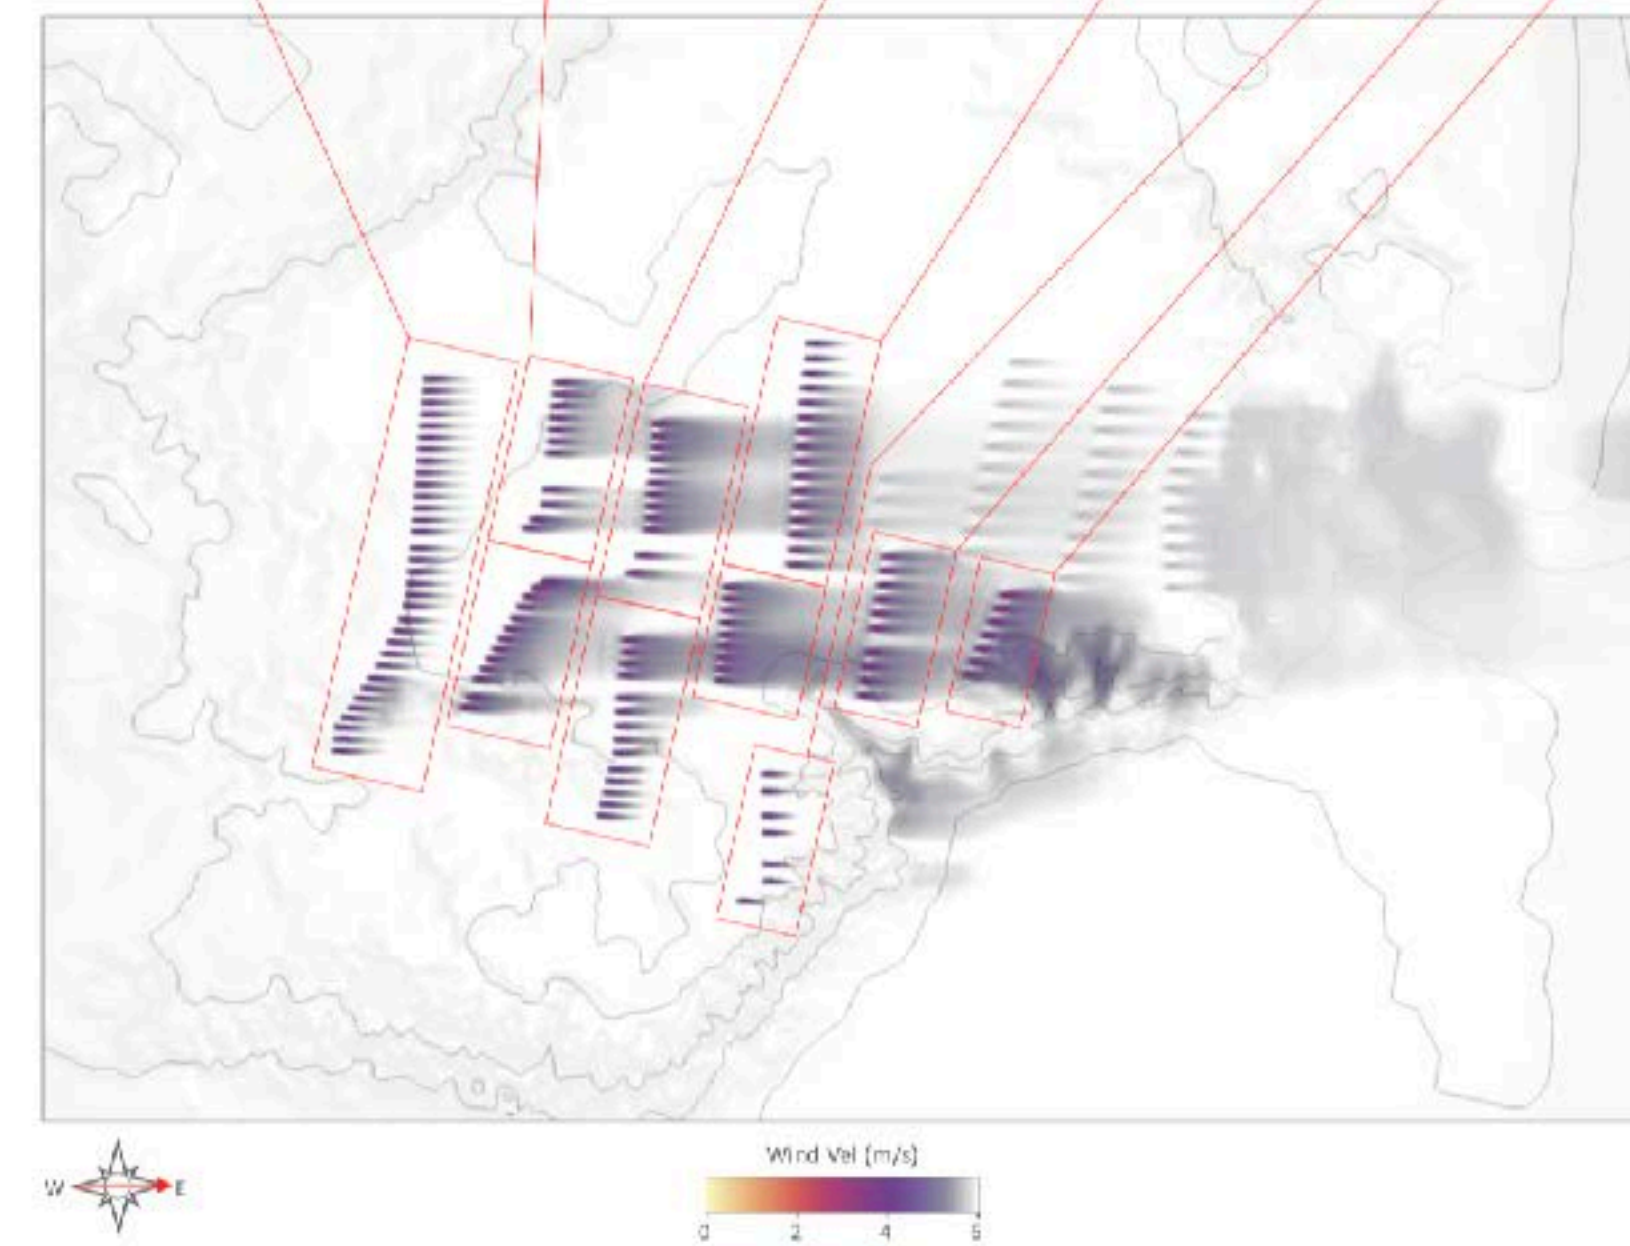

With color scale and orientation from Illustrator
Correct background brightness to make data clearer
Attenuate windmills excluded from the study

V1

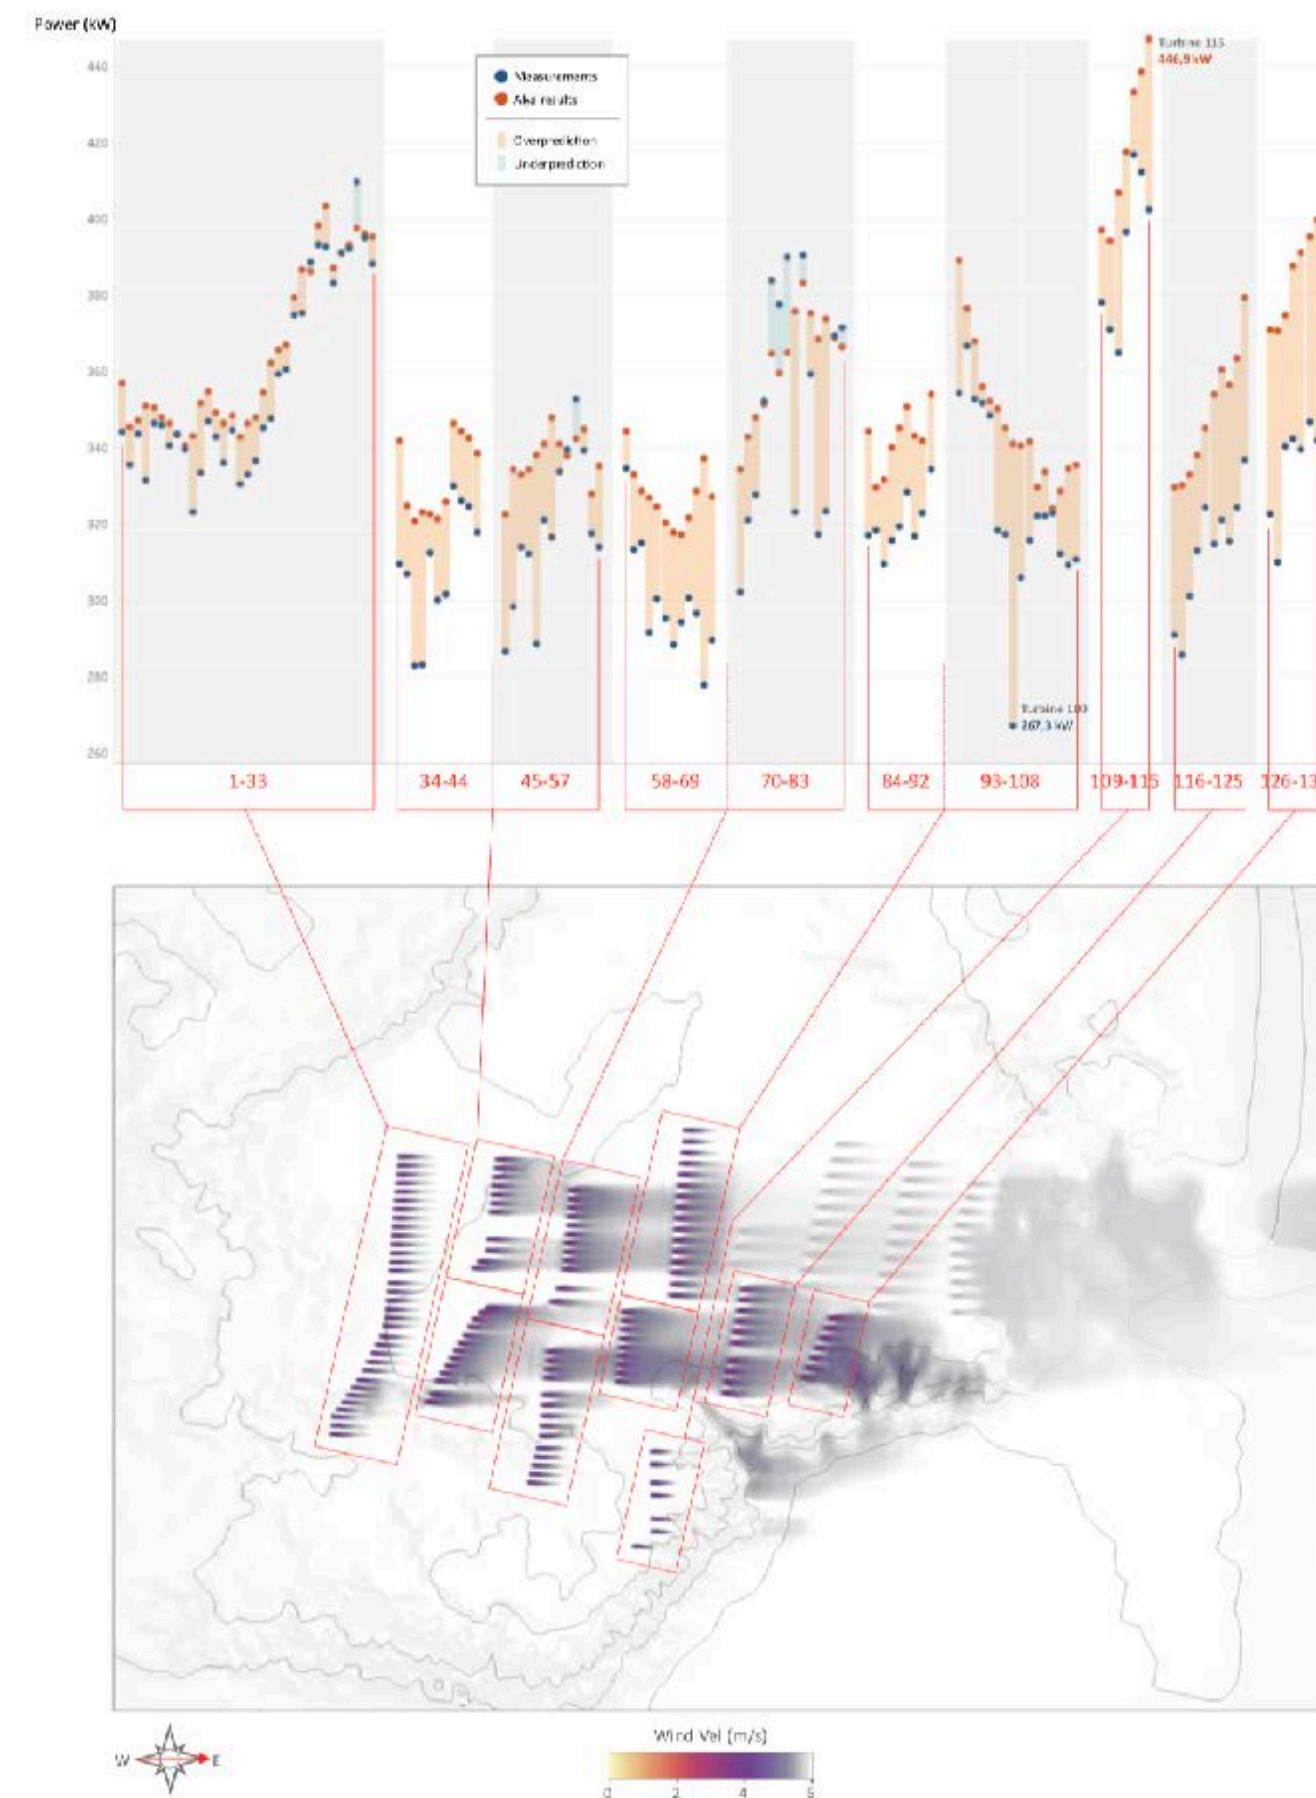

V2

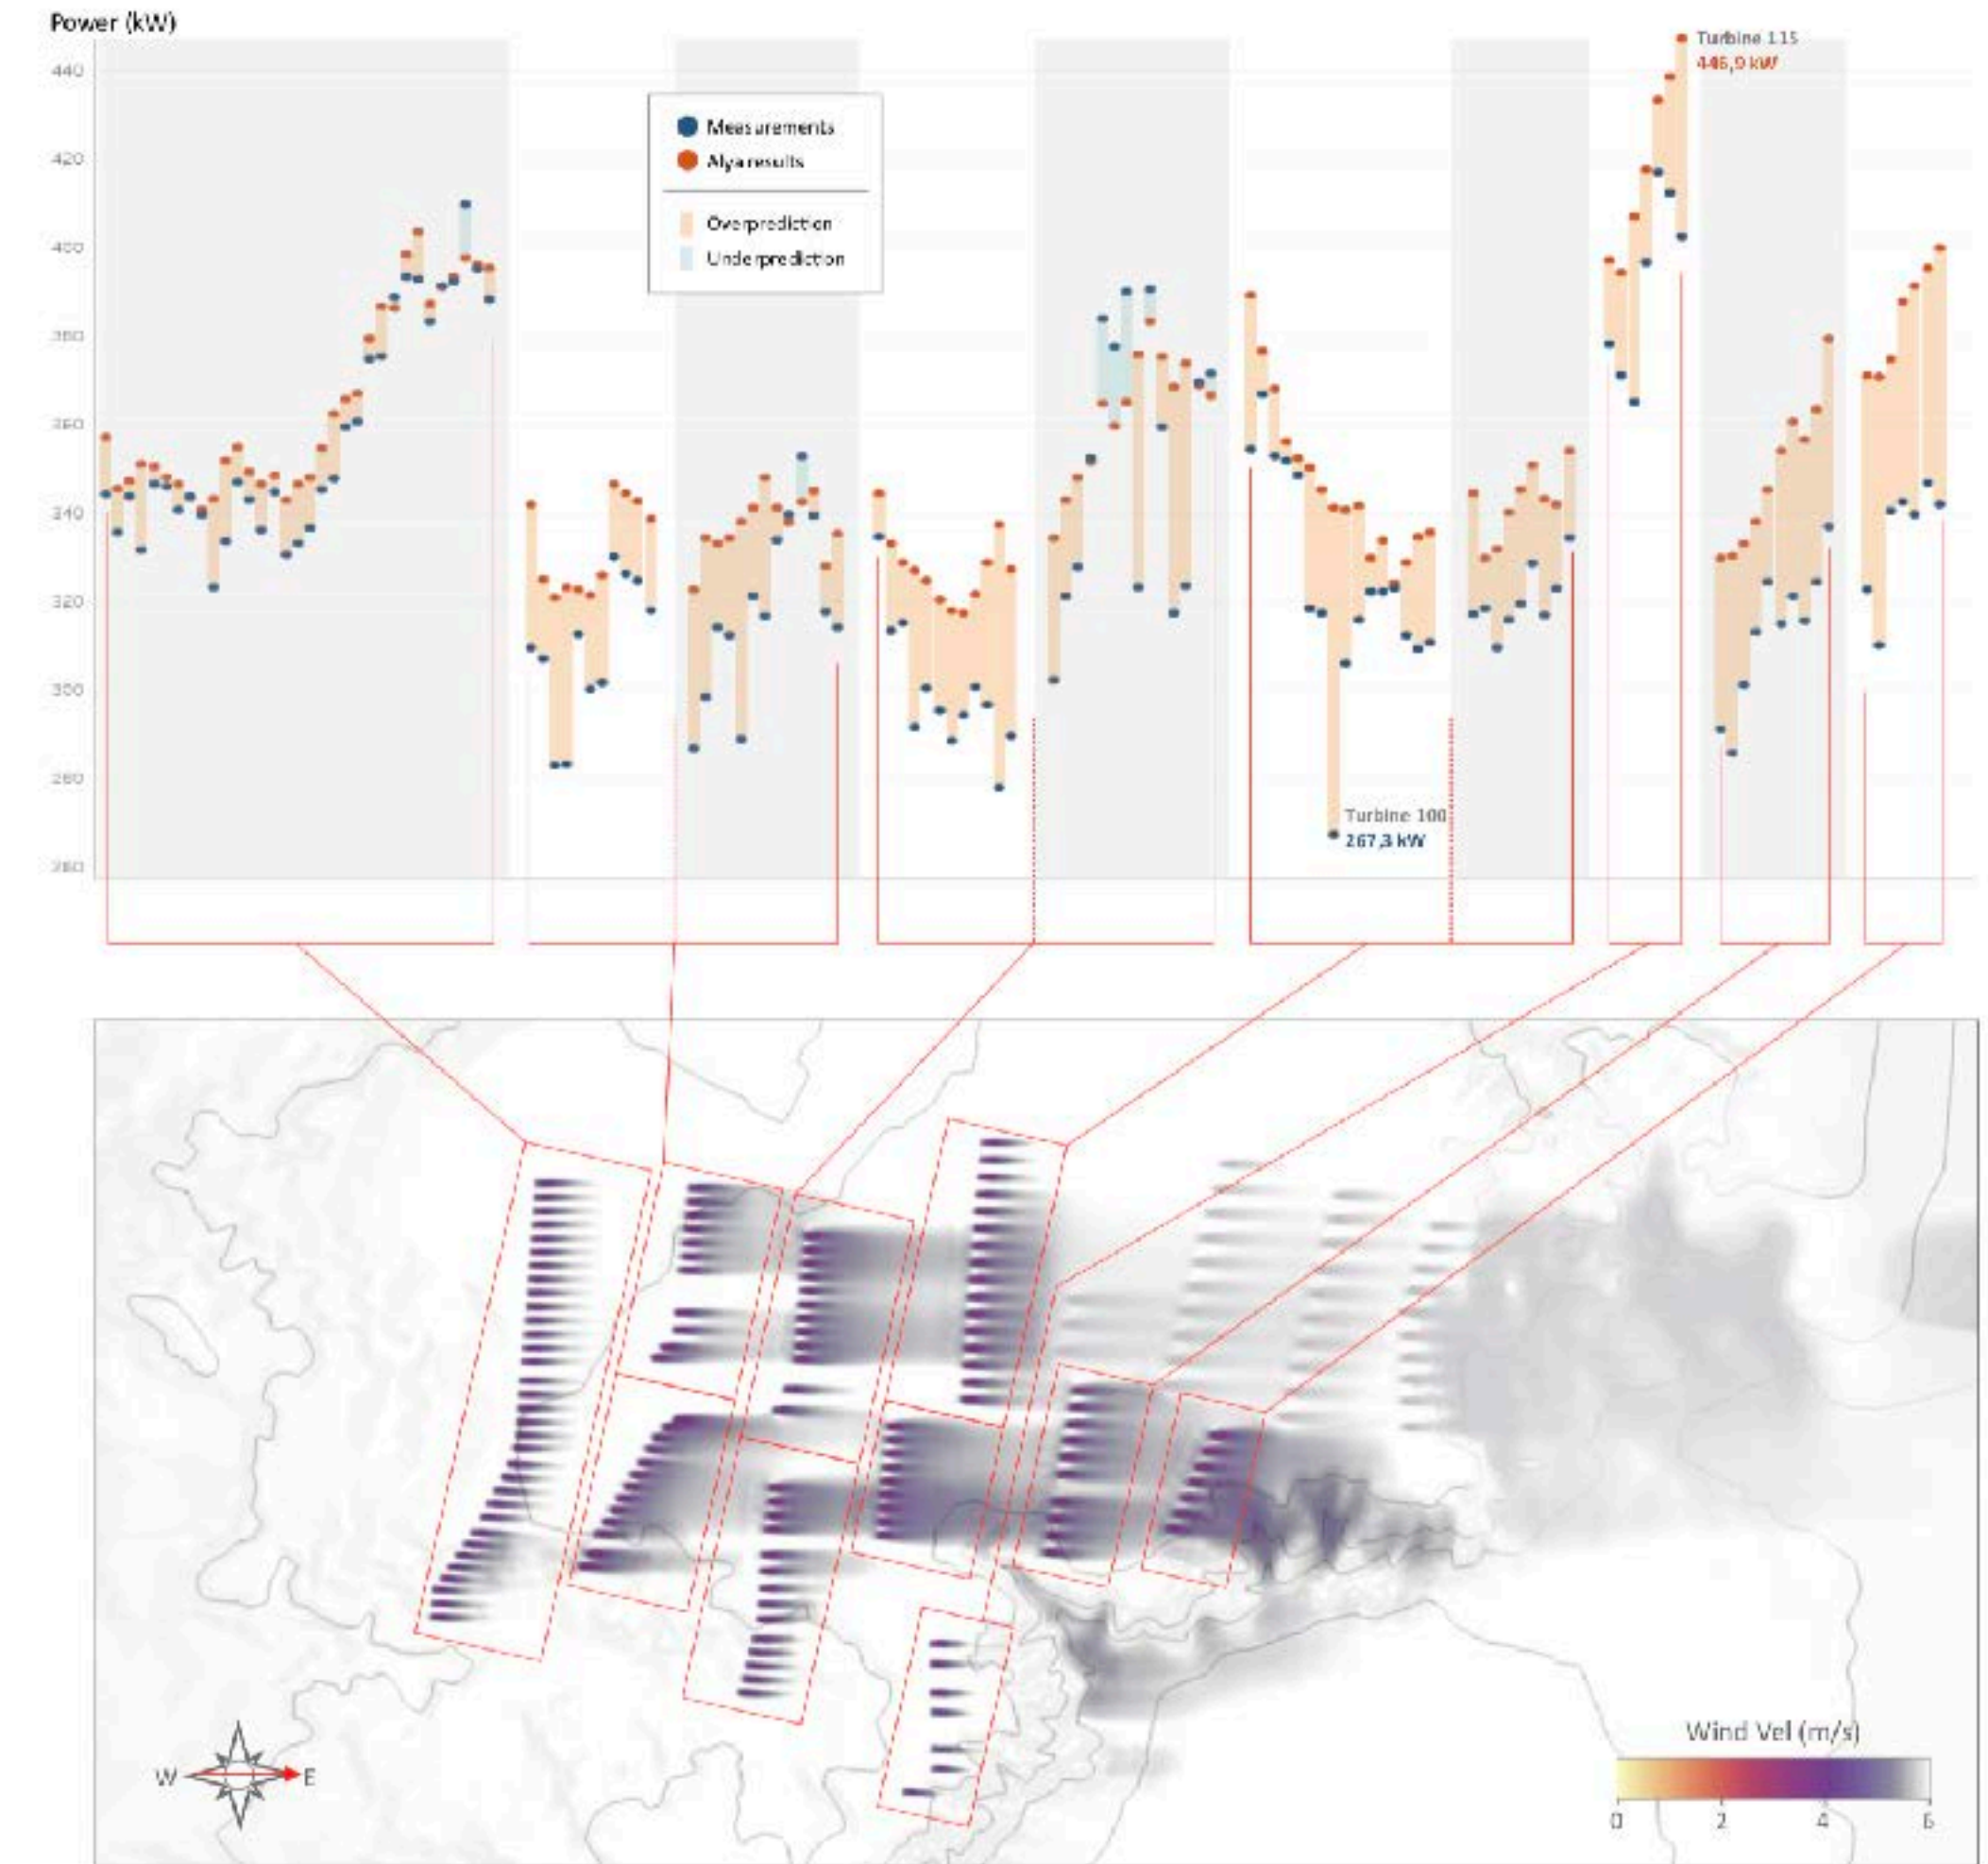

- Cut unnecessary space of the map
- make plot narrower for composition
- remove numbers
- SWITCH group of windmills to match reading order in the map
- Legends inside the plots

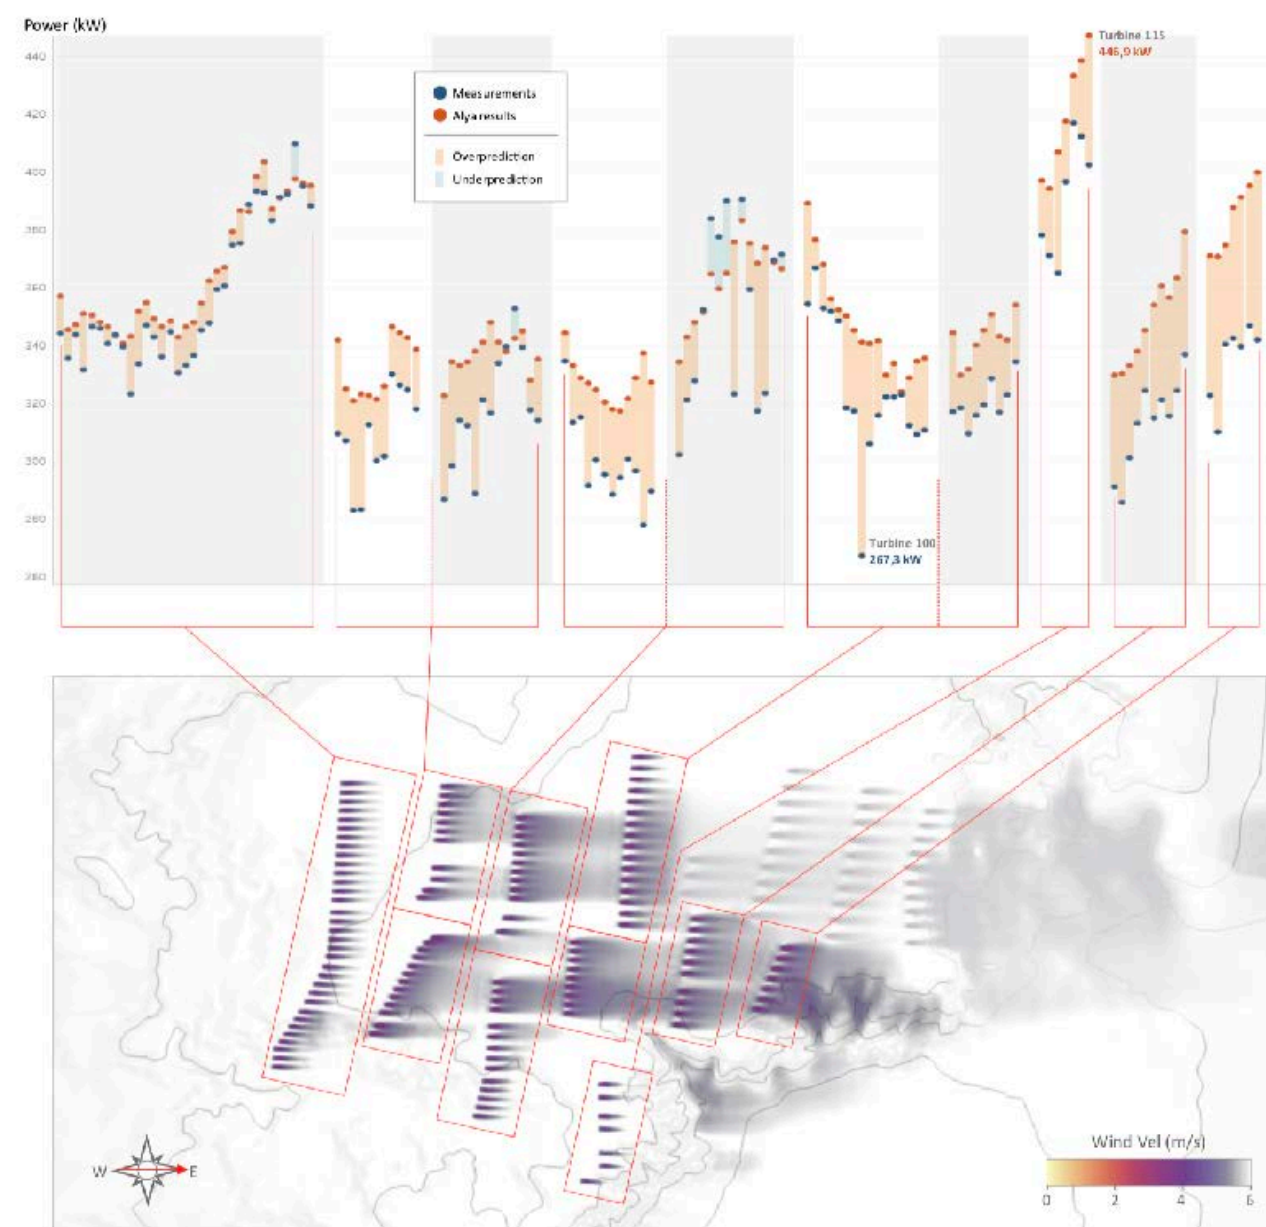

V2

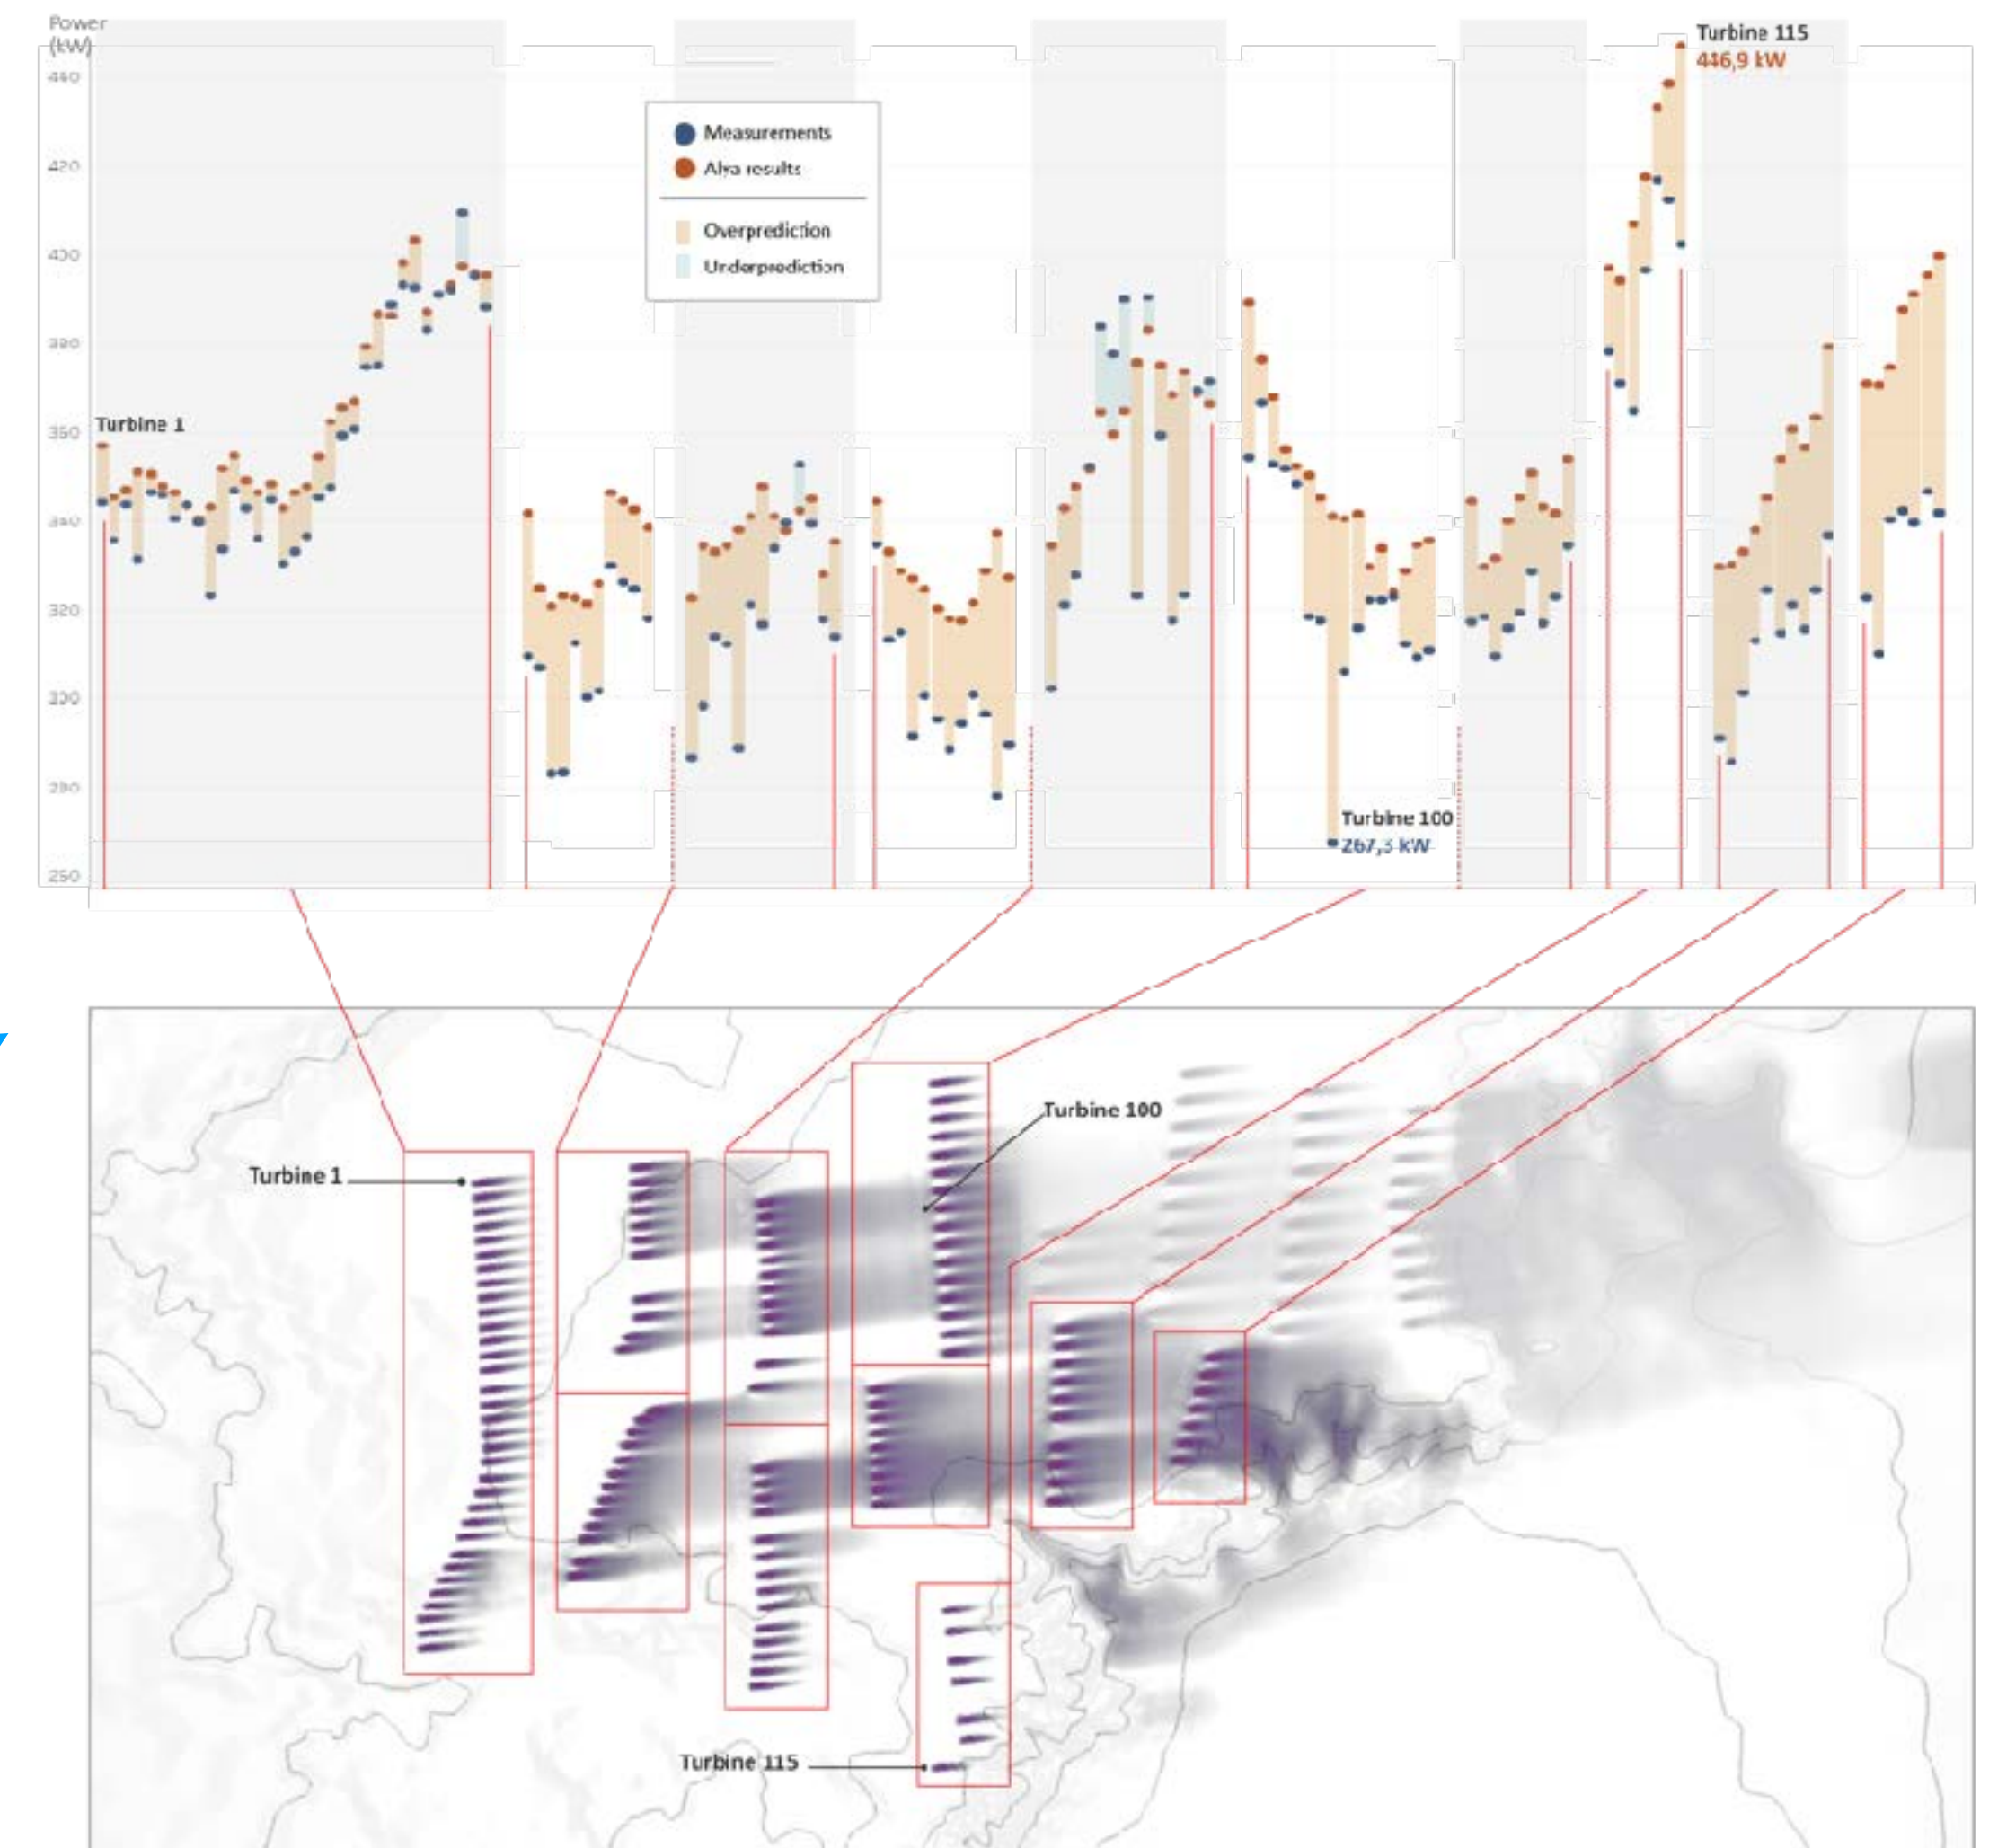

V4

V4

V7

- Rotate map to put boxes straight
- Put the red brackets where the X axis was
- Mark the first, highest, and lowest-value windmills in both charts to mark reading order

Annual energy production

Final image

- Enclose and separate the plots for readability: it is not a single plot (difference chart bigger, it has more information)
- Light color background to highlight the plots
- Two fonts: titles (big and light) and legends (small and bold)
- All data points against light, desaturated backgrounds for contrast
- **Unanticipated perk of this plot:** Relation between turbulence and the accuracy of the results. Known effect by researchers but a good way to explain it to non-experts

Estimation Vs. Measurement

Sisante windfarm

Annual energy production

Caveats

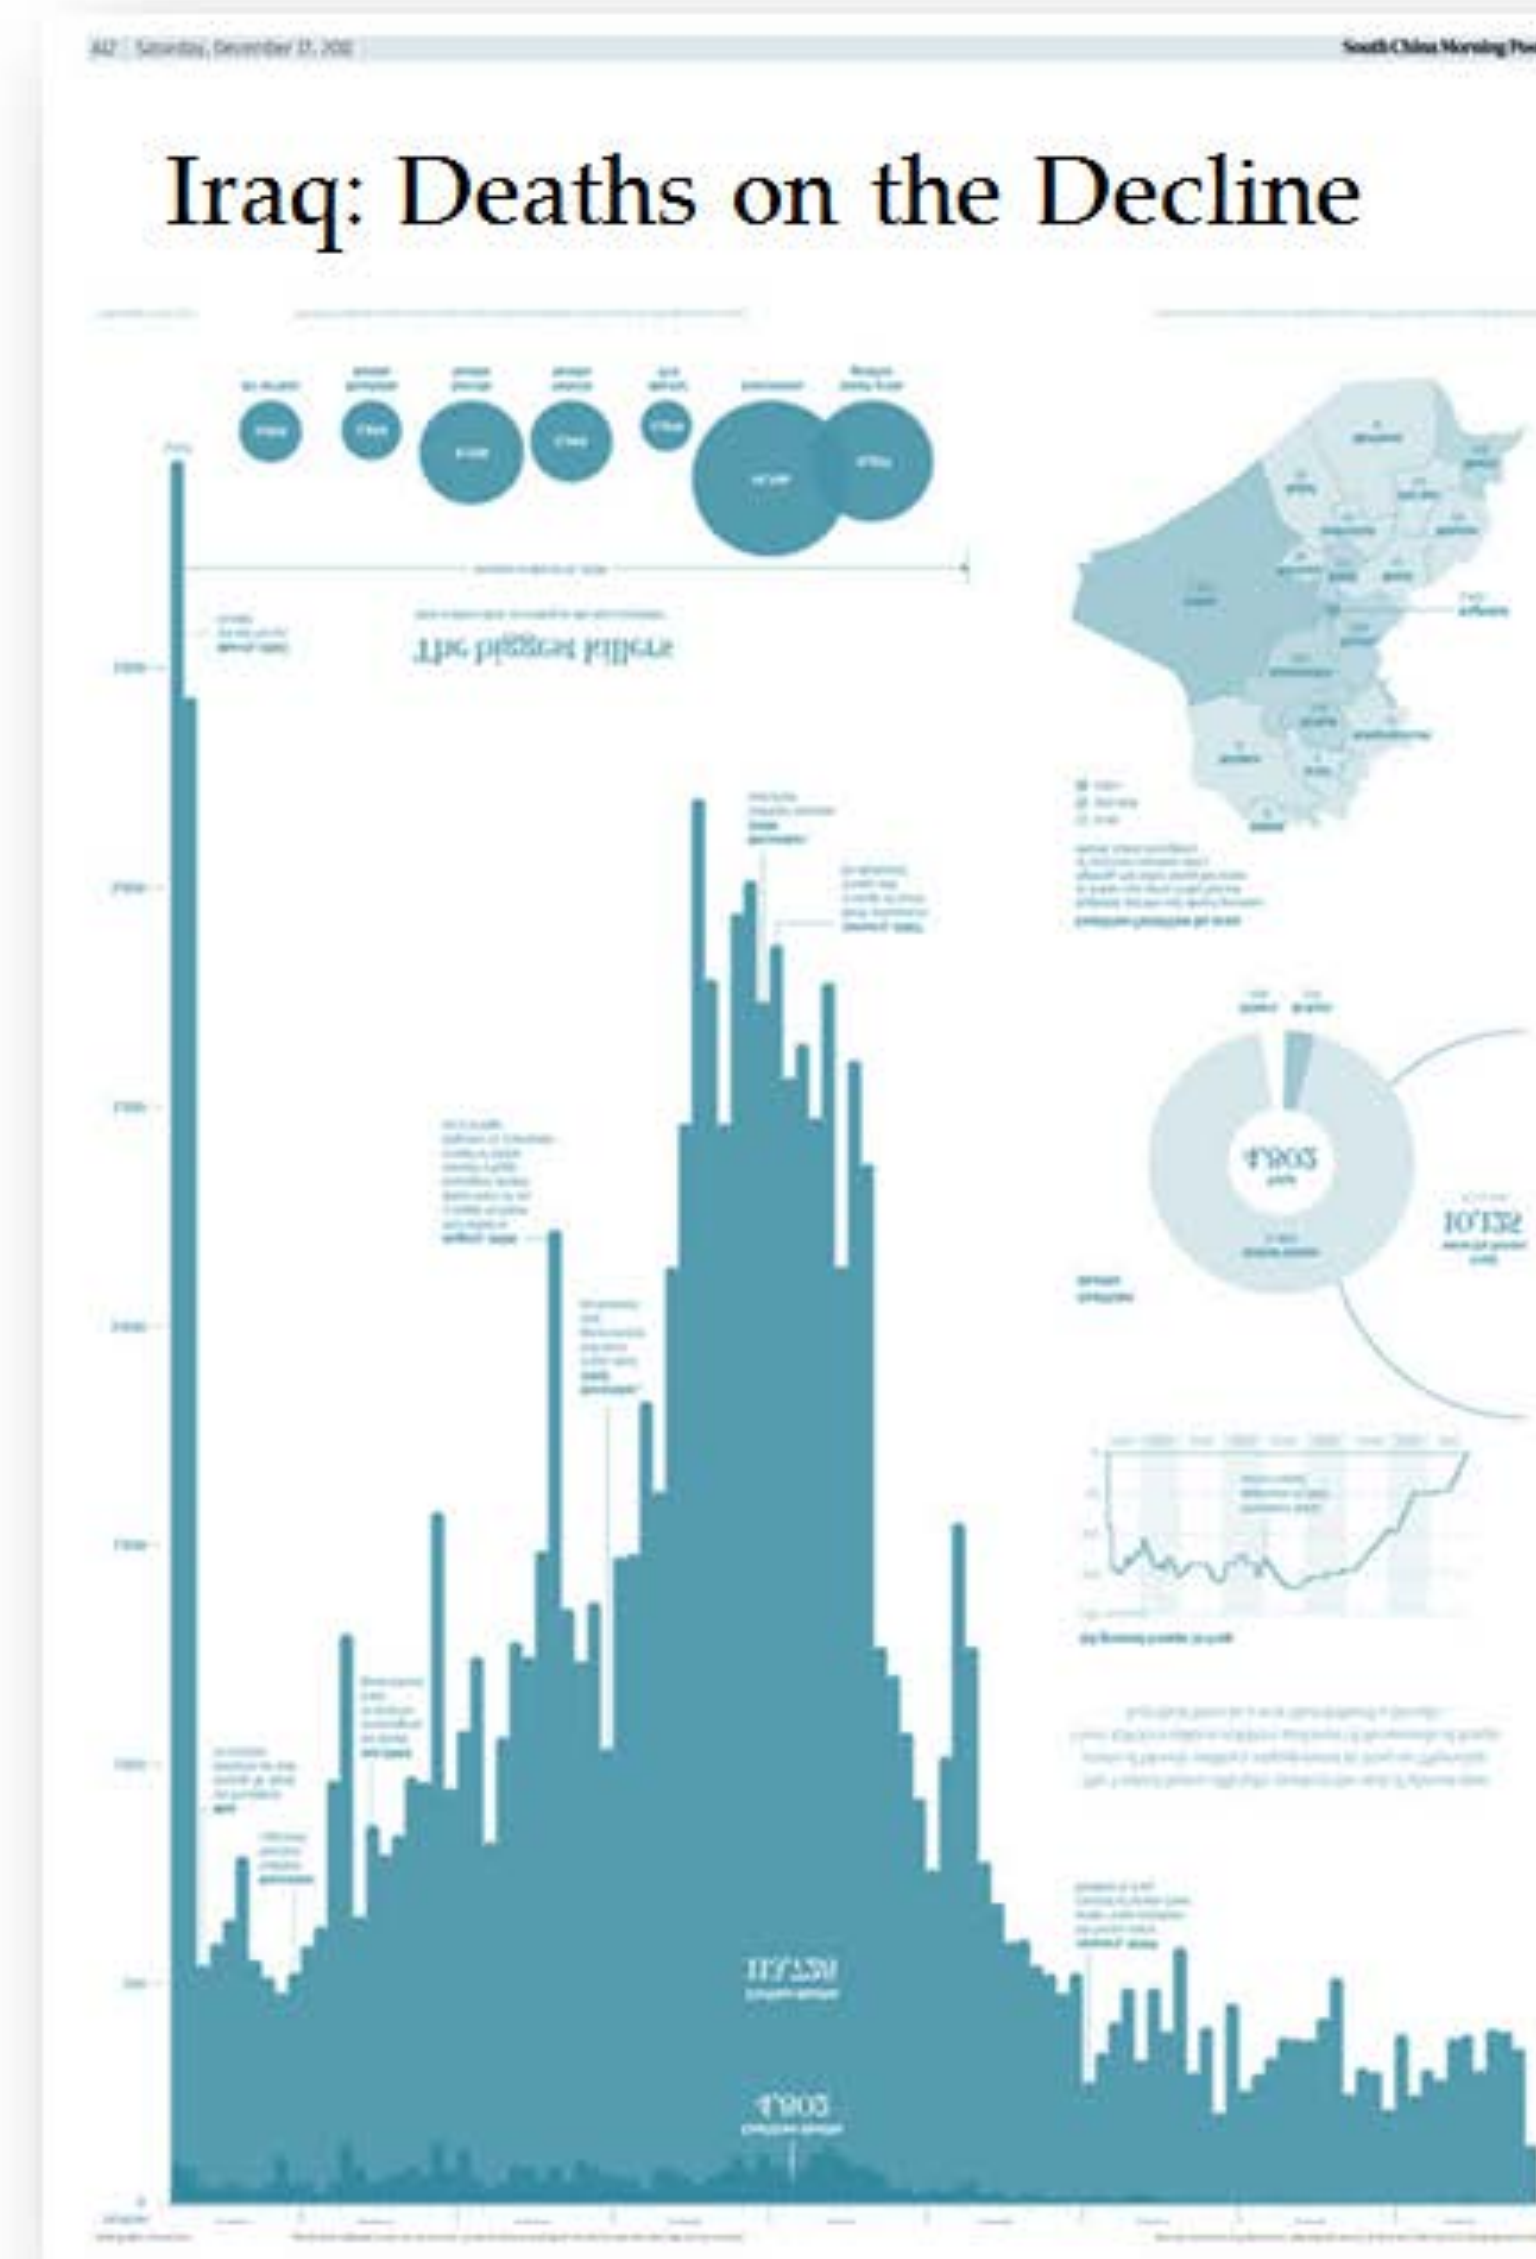

- Unclear if the windmill order is understandable in both charts- User tests needed
- Attenuated windmills excluded from the study can be confused with high speed values in the scale. New simulation needed
- More technical details (dates of the measurements, simulation method, model name, etc) needed for a stand-alone poster

Estimation Vs. Measurement

Sisante windfarm

There is always a story

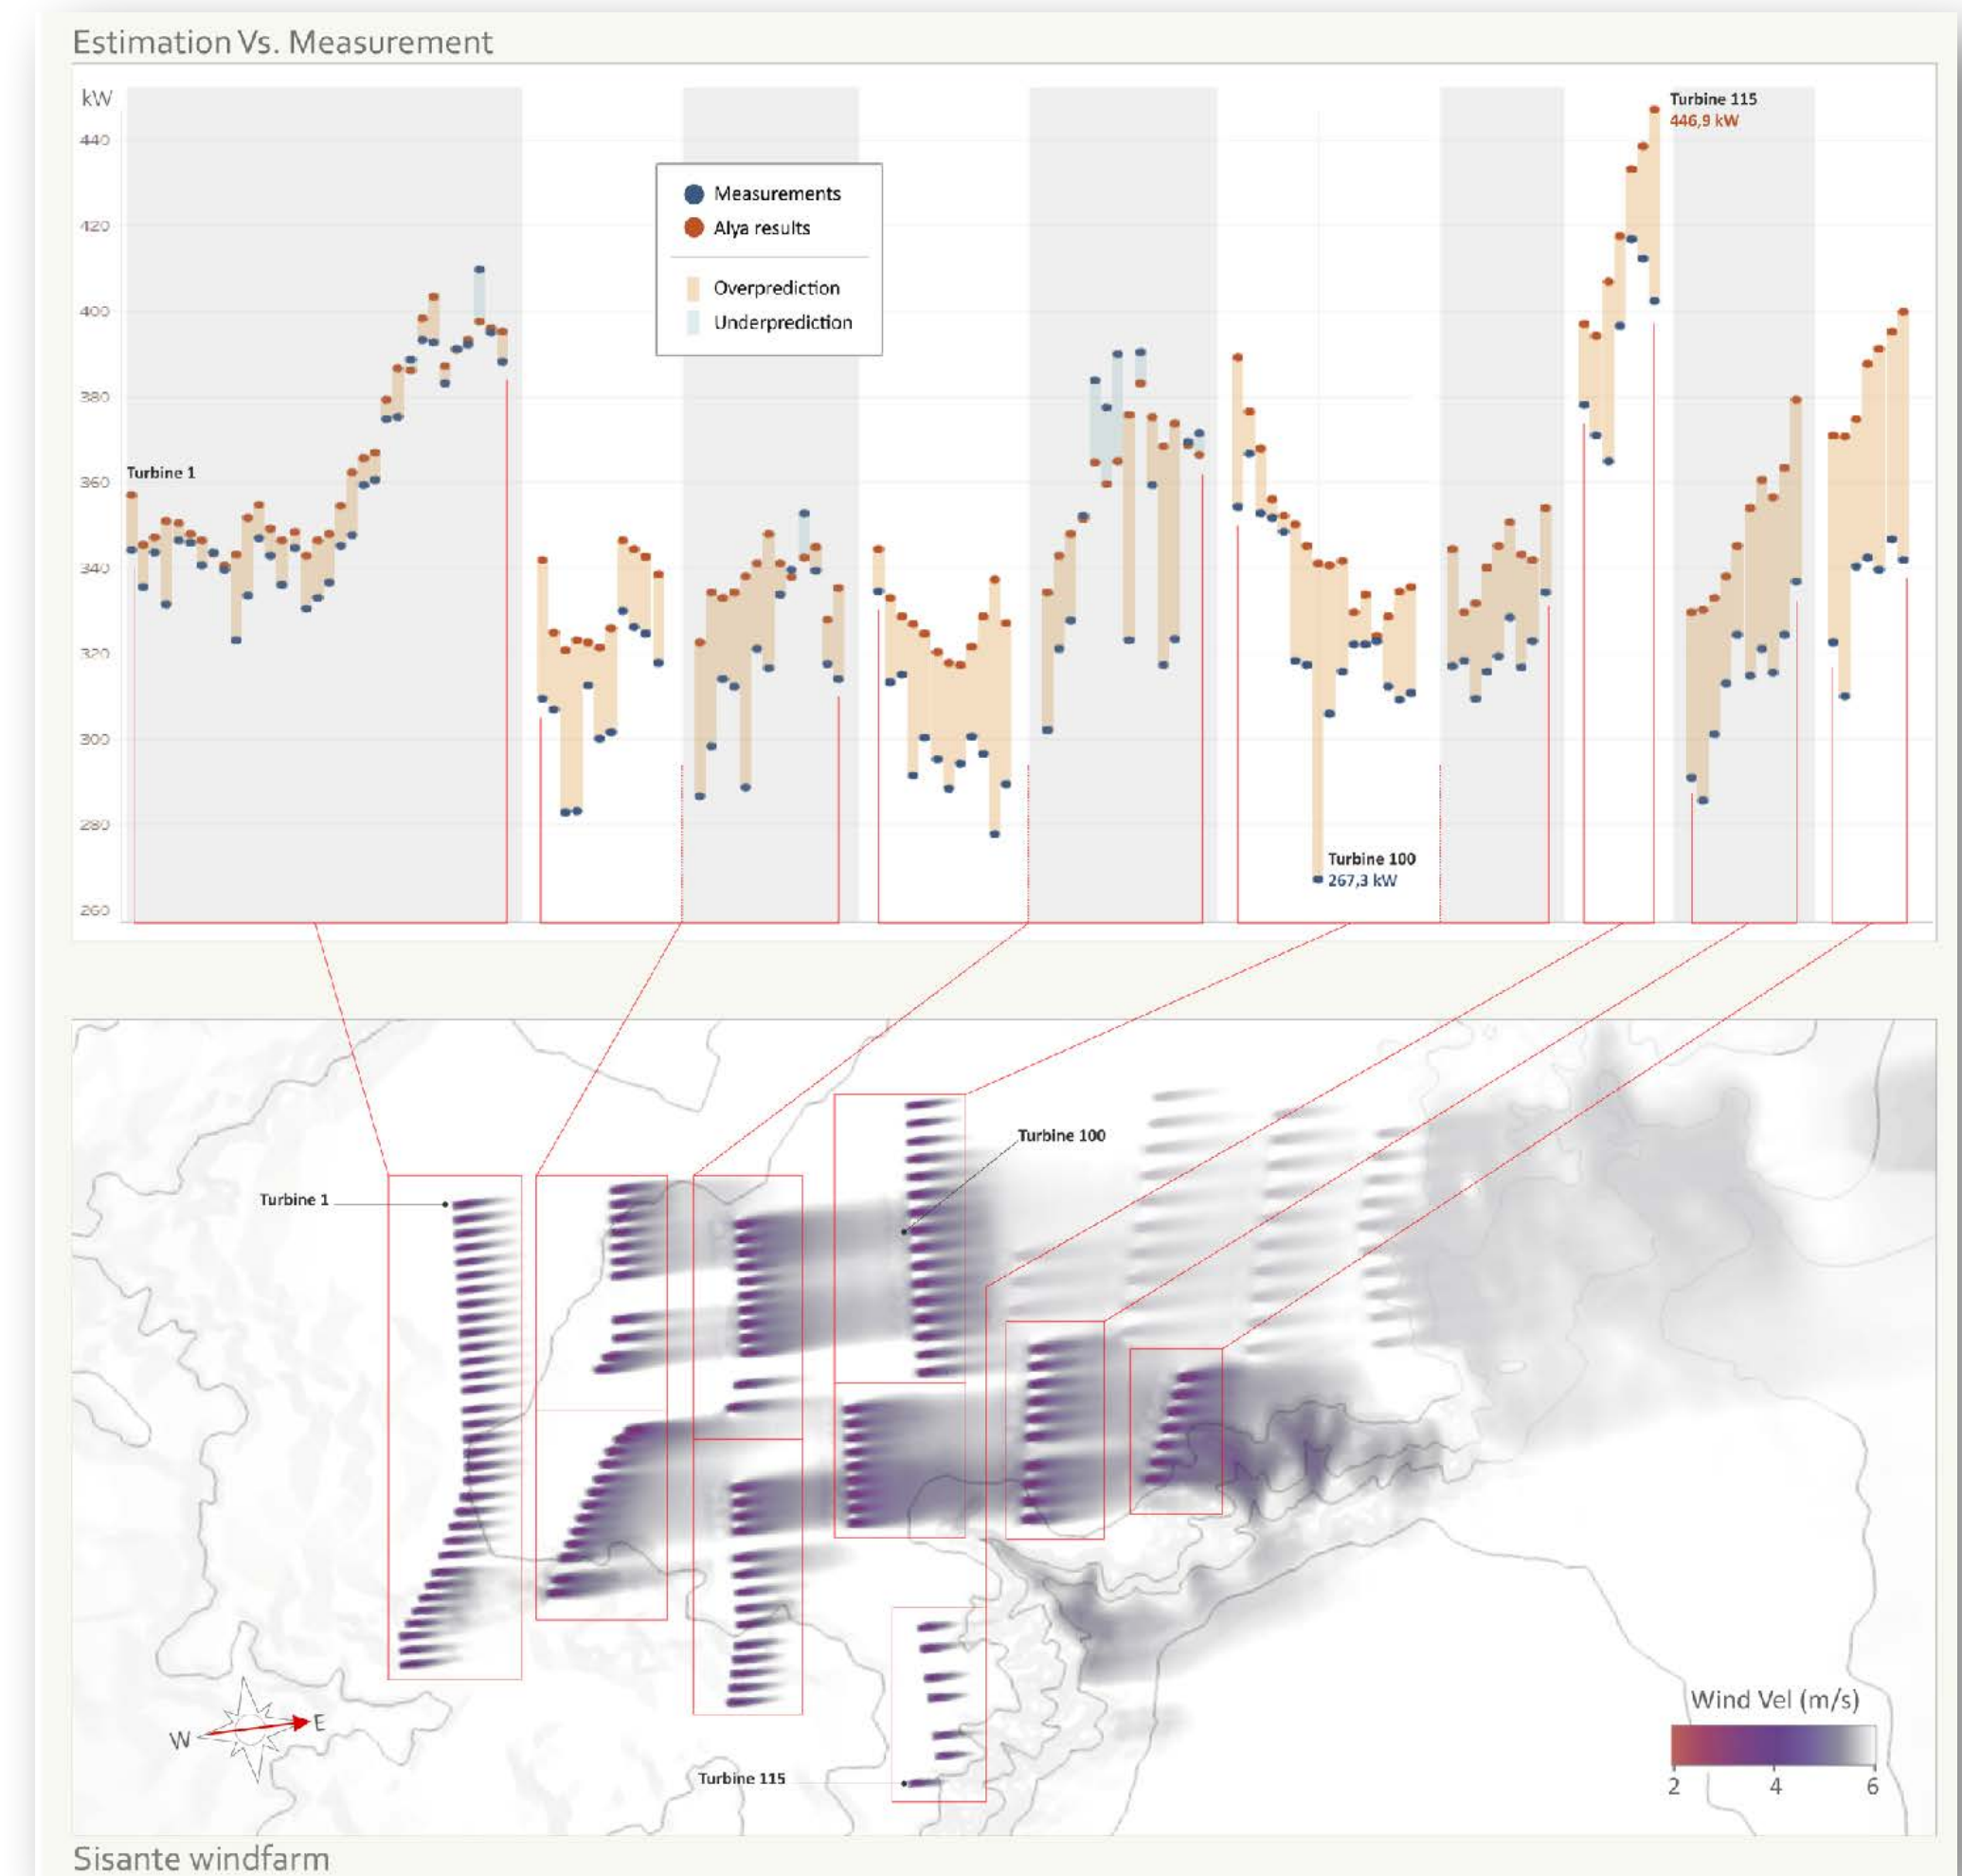

There is always a story

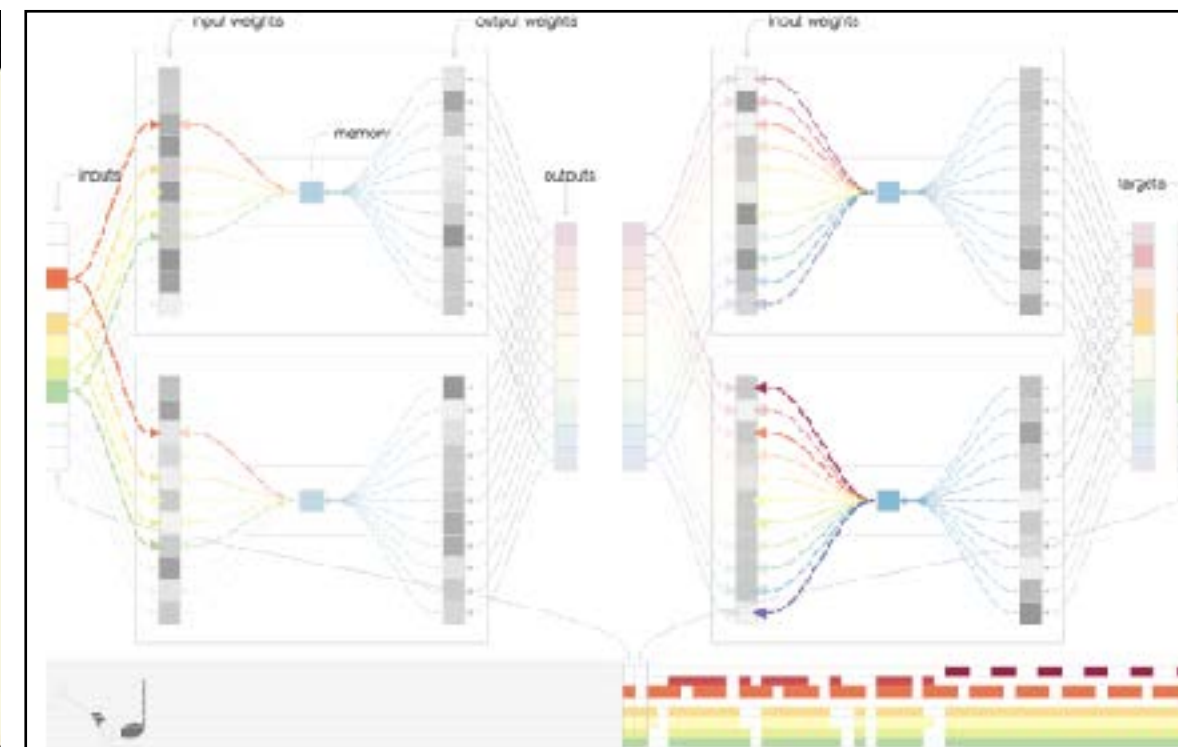

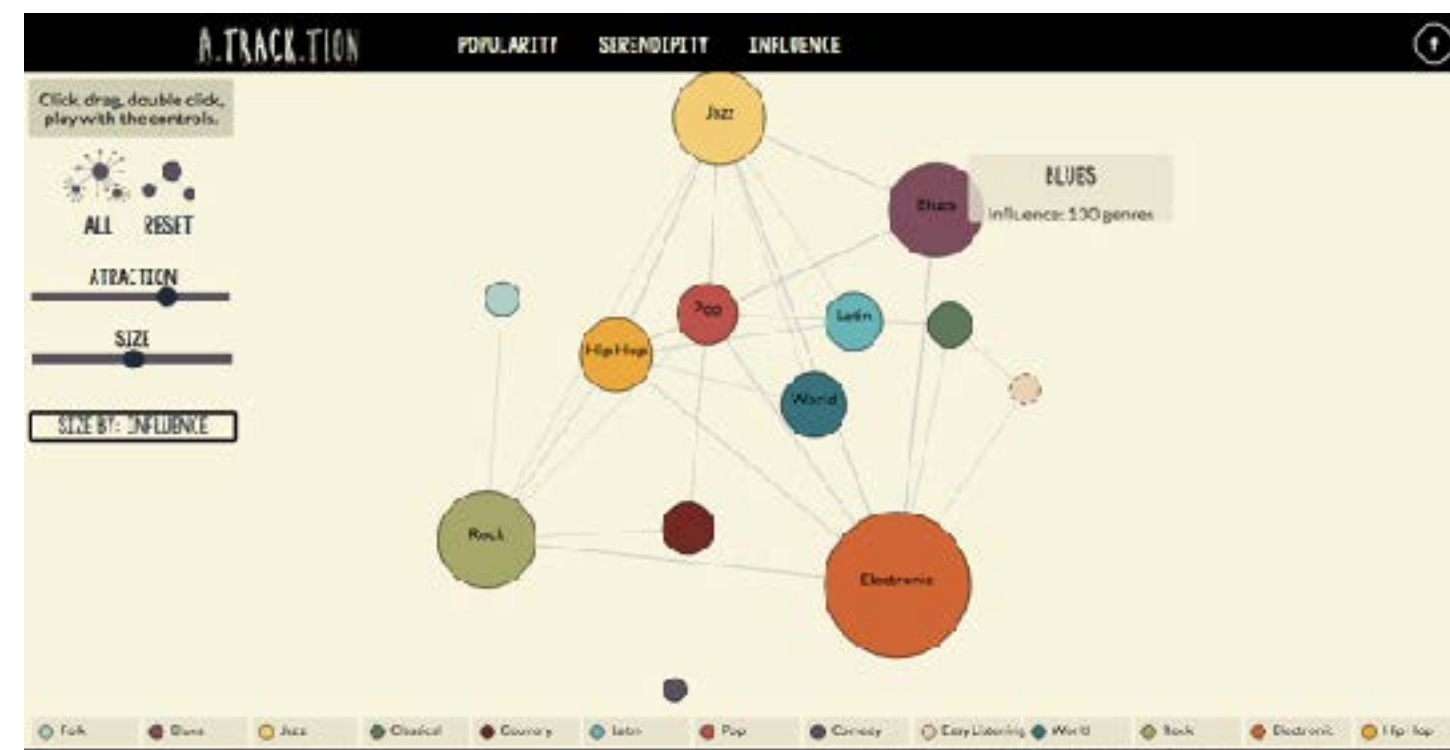

My results somehow correlate to measurements

Vs.

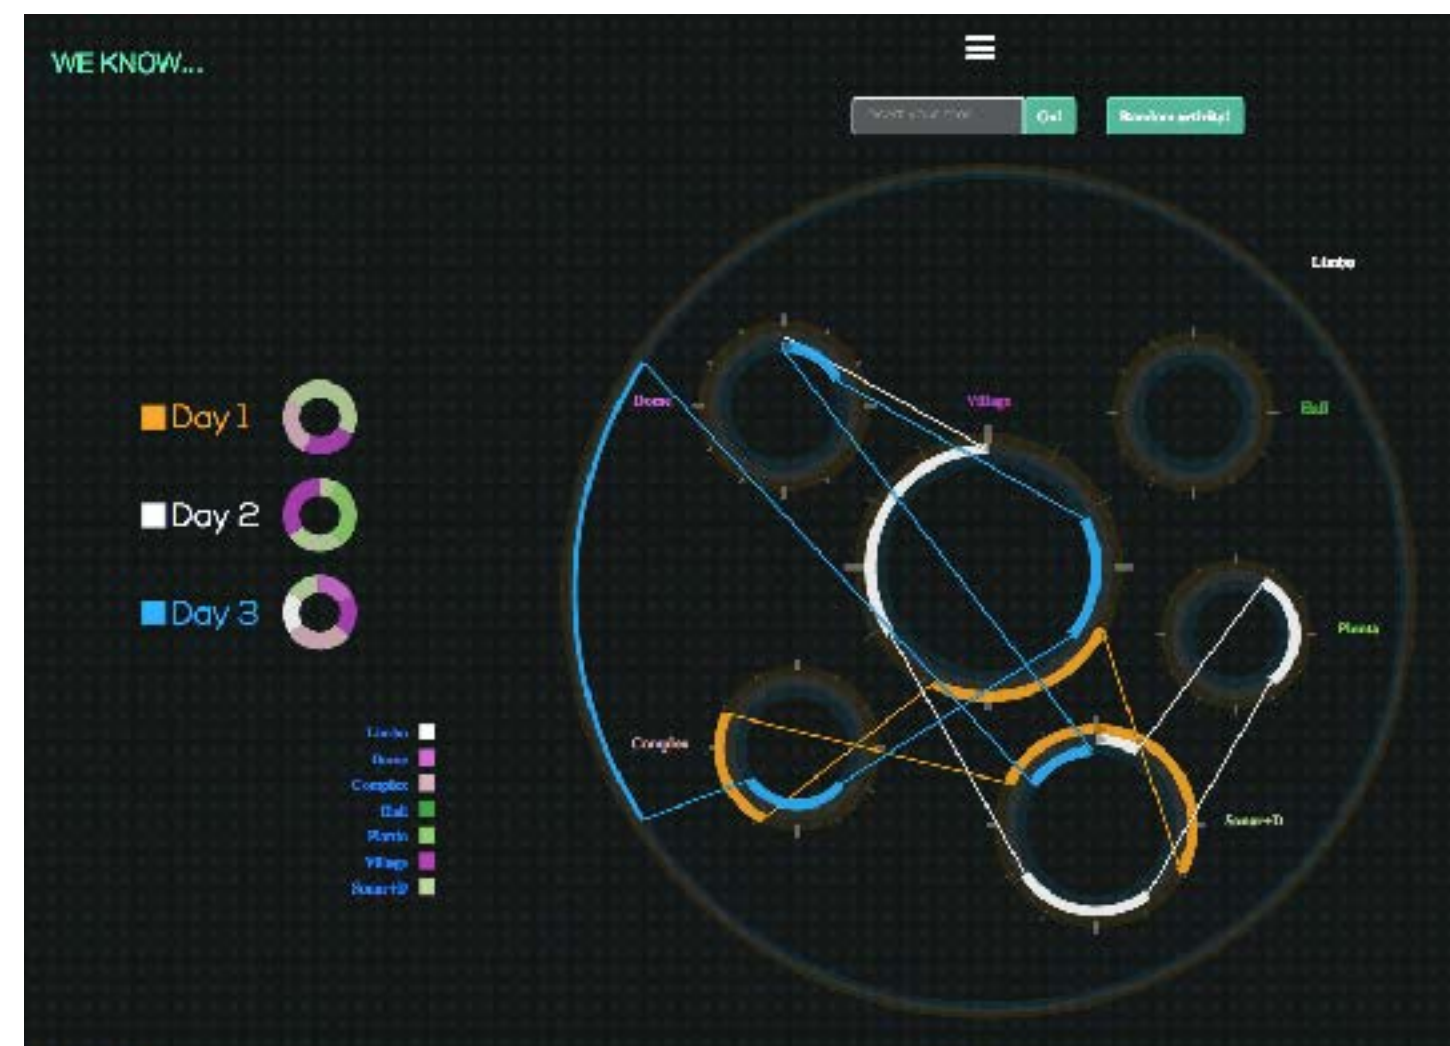

My model is not capturing turbulent wakes accurately

BSC Data Analytics and Visualization Group

Hyper-realistic
data visualisation

High-quality images under film industry standards

www.bsc.es/viz

Over Produced data visualisation

Why?

High-end renders of data visualisation

Why?

- Highest possible impact
- Memorability

Sniff

Visualization of Airflow through the Human Respiratory System

<https://youtu.be/72OP03QOpXw>

Scientists

Scientific Reports **6**, Article number: 21220 (2016)

General public

La Vanguardia (Spanish newspaper) 17/02/2016

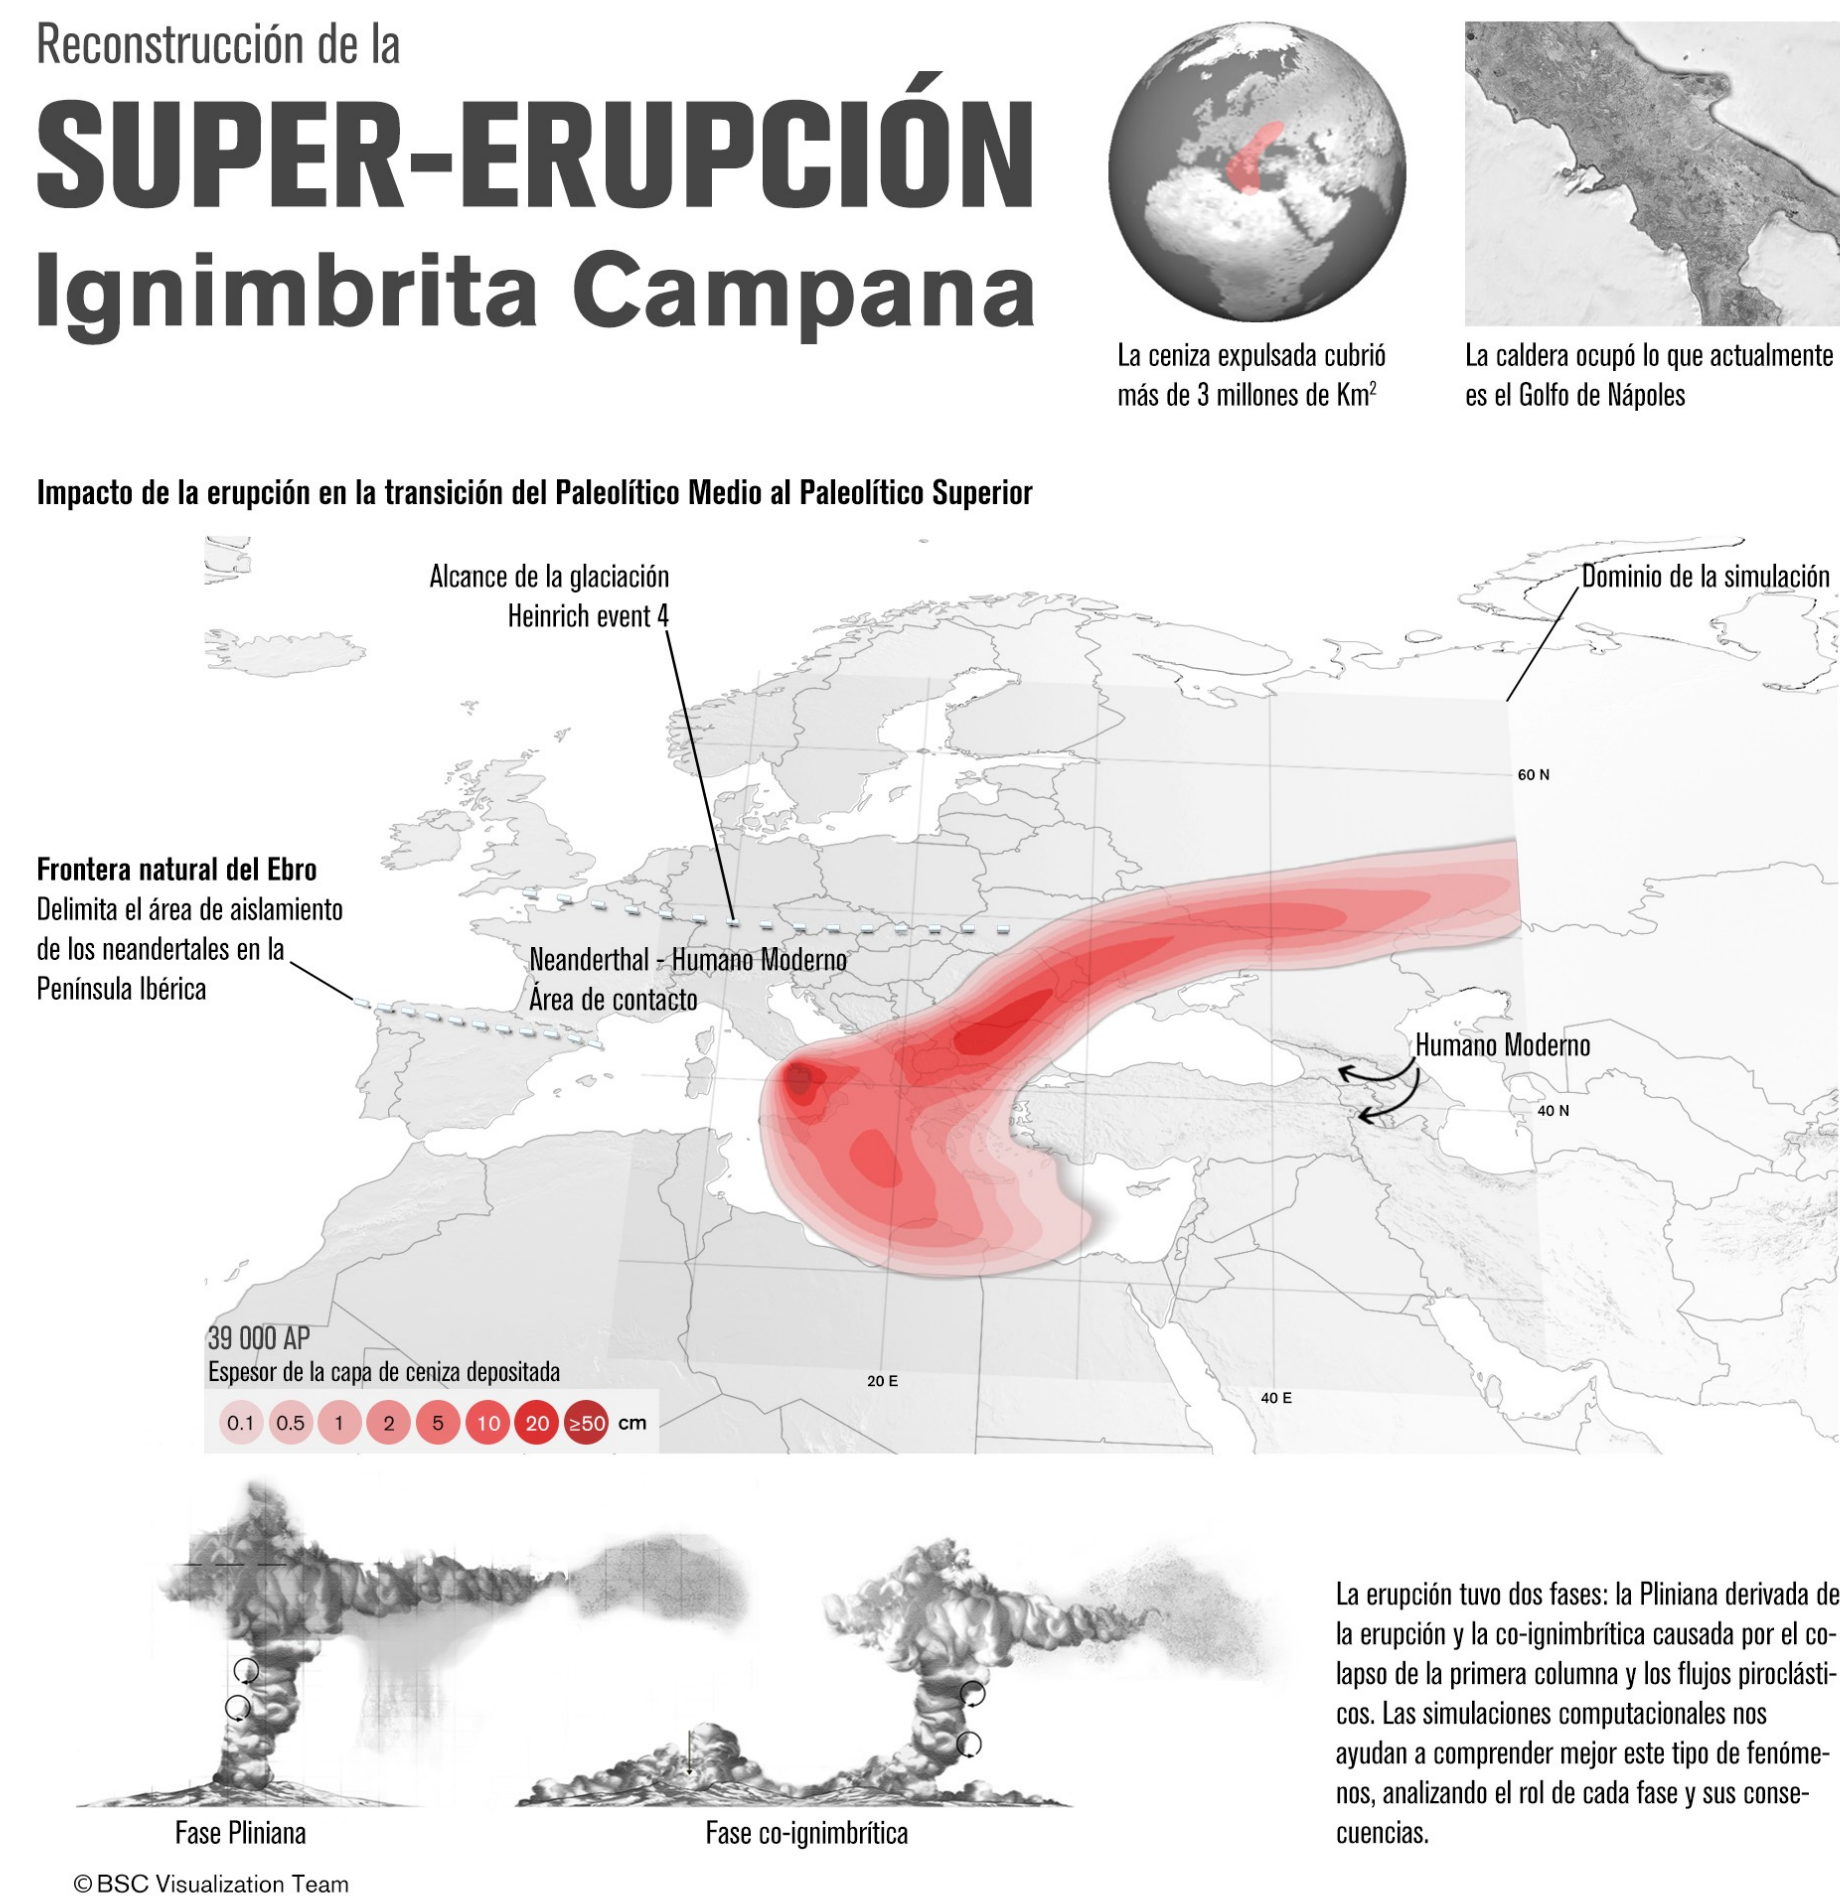

Photo realistic data visualisation

$$C_{AB} = \frac{1}{2}(1 - e^{-2X_{AB}})$$

How?

To achieve it, we need artist level of control over camera, light, animation, textures, and render quality

Super nice data visualisation

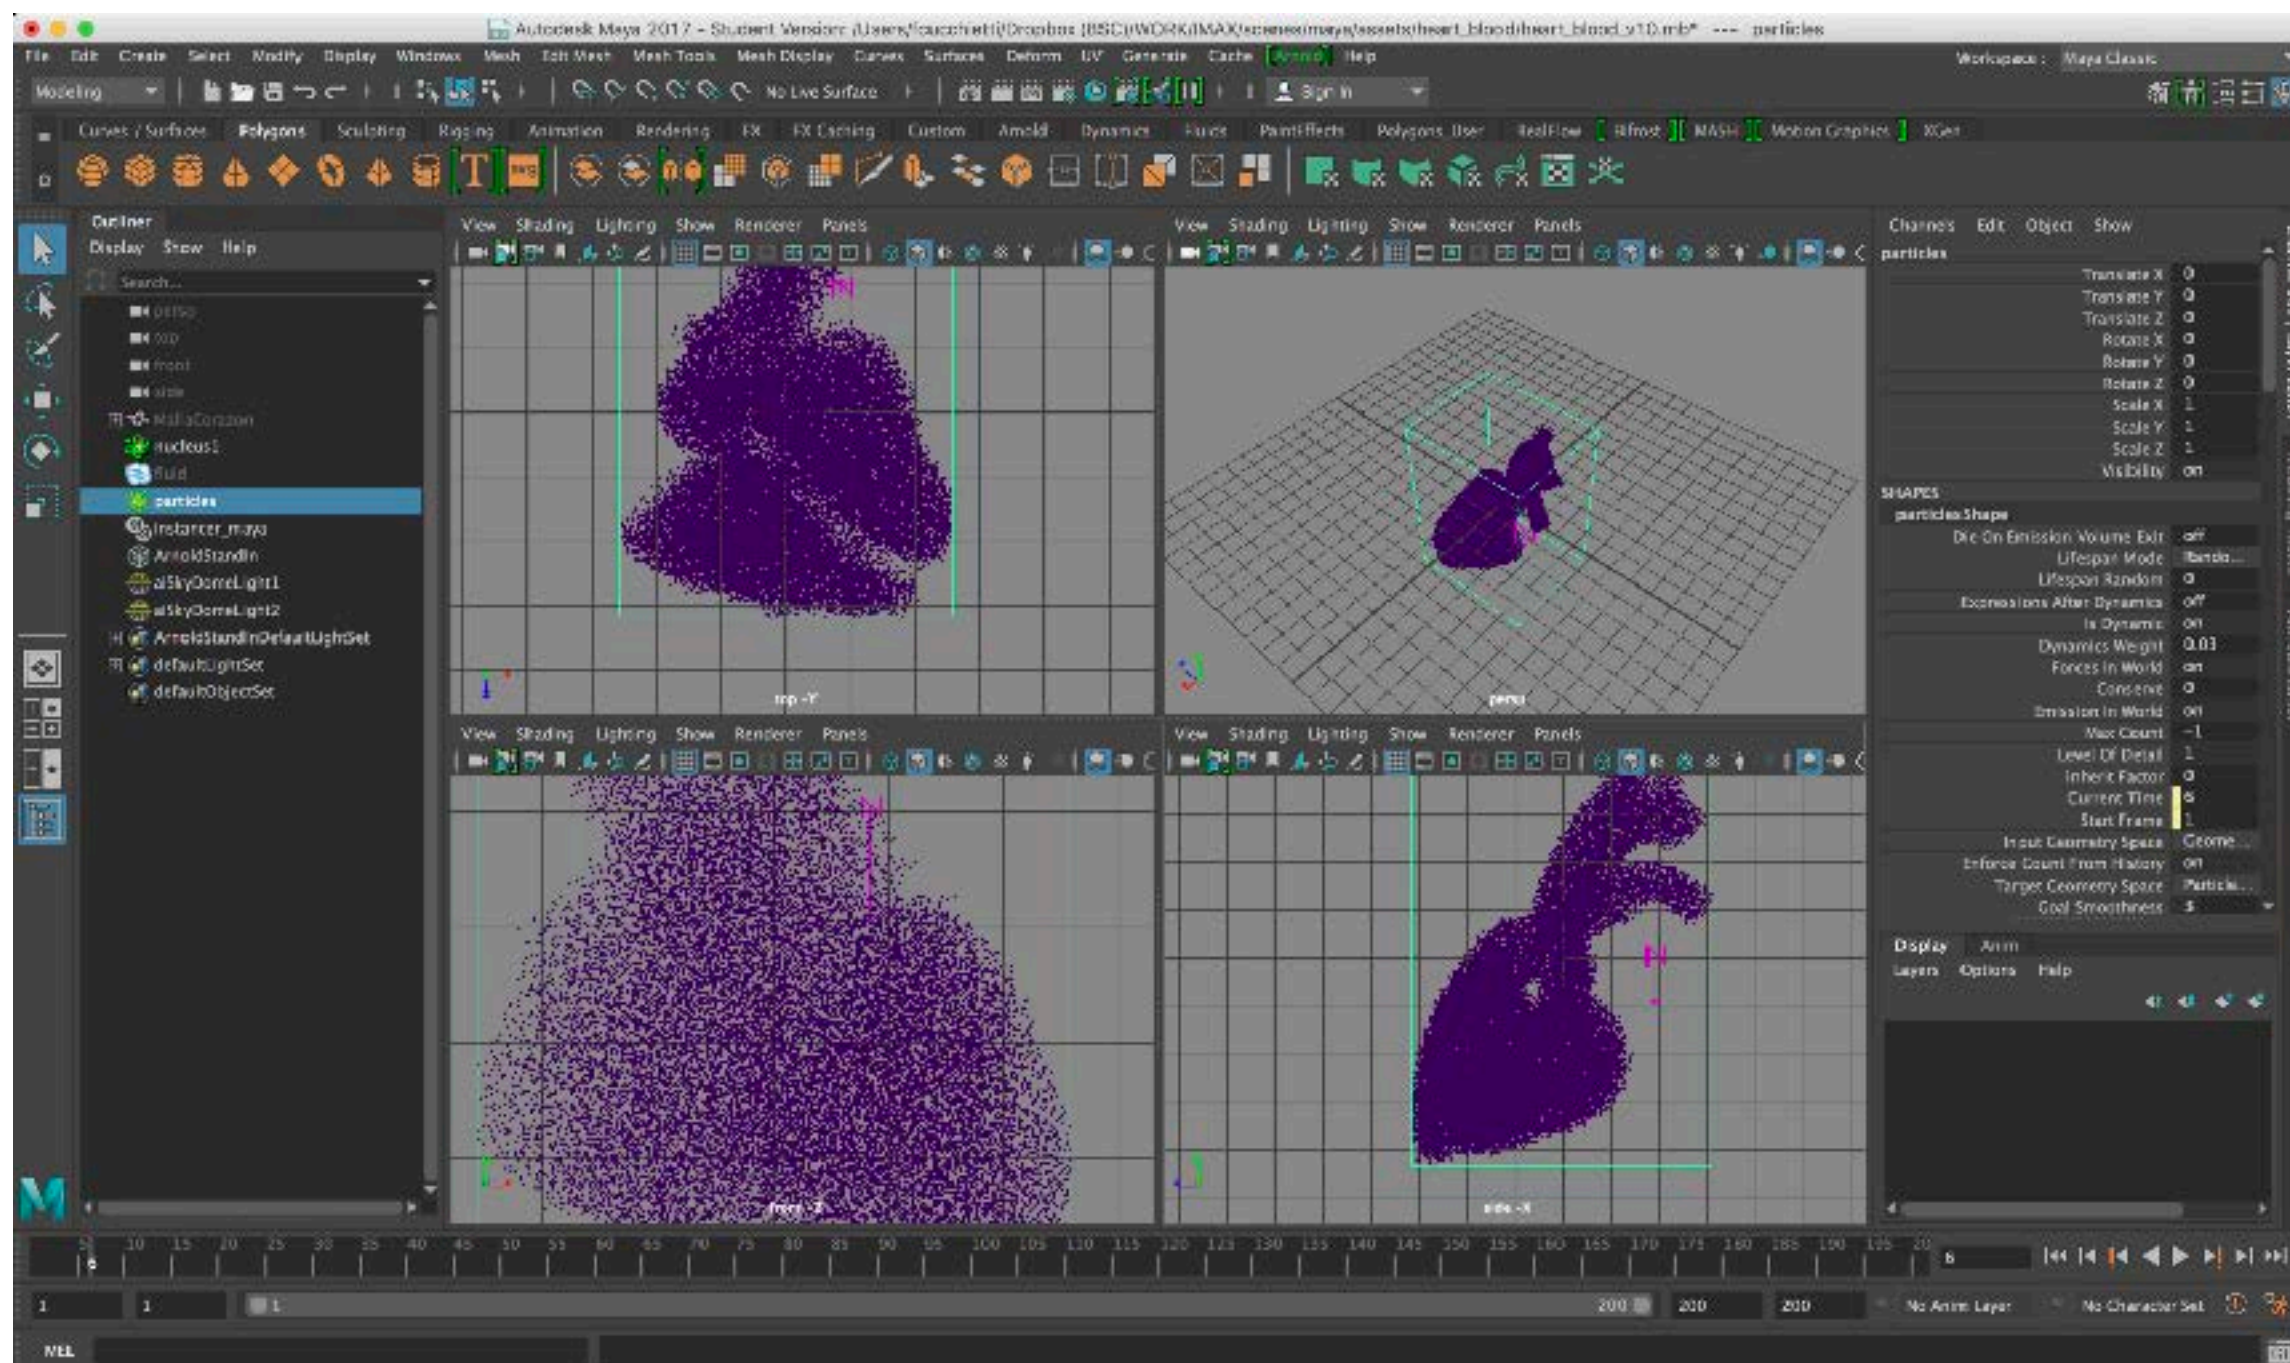

<https://youtu.be/VooETfsDErM>

How?

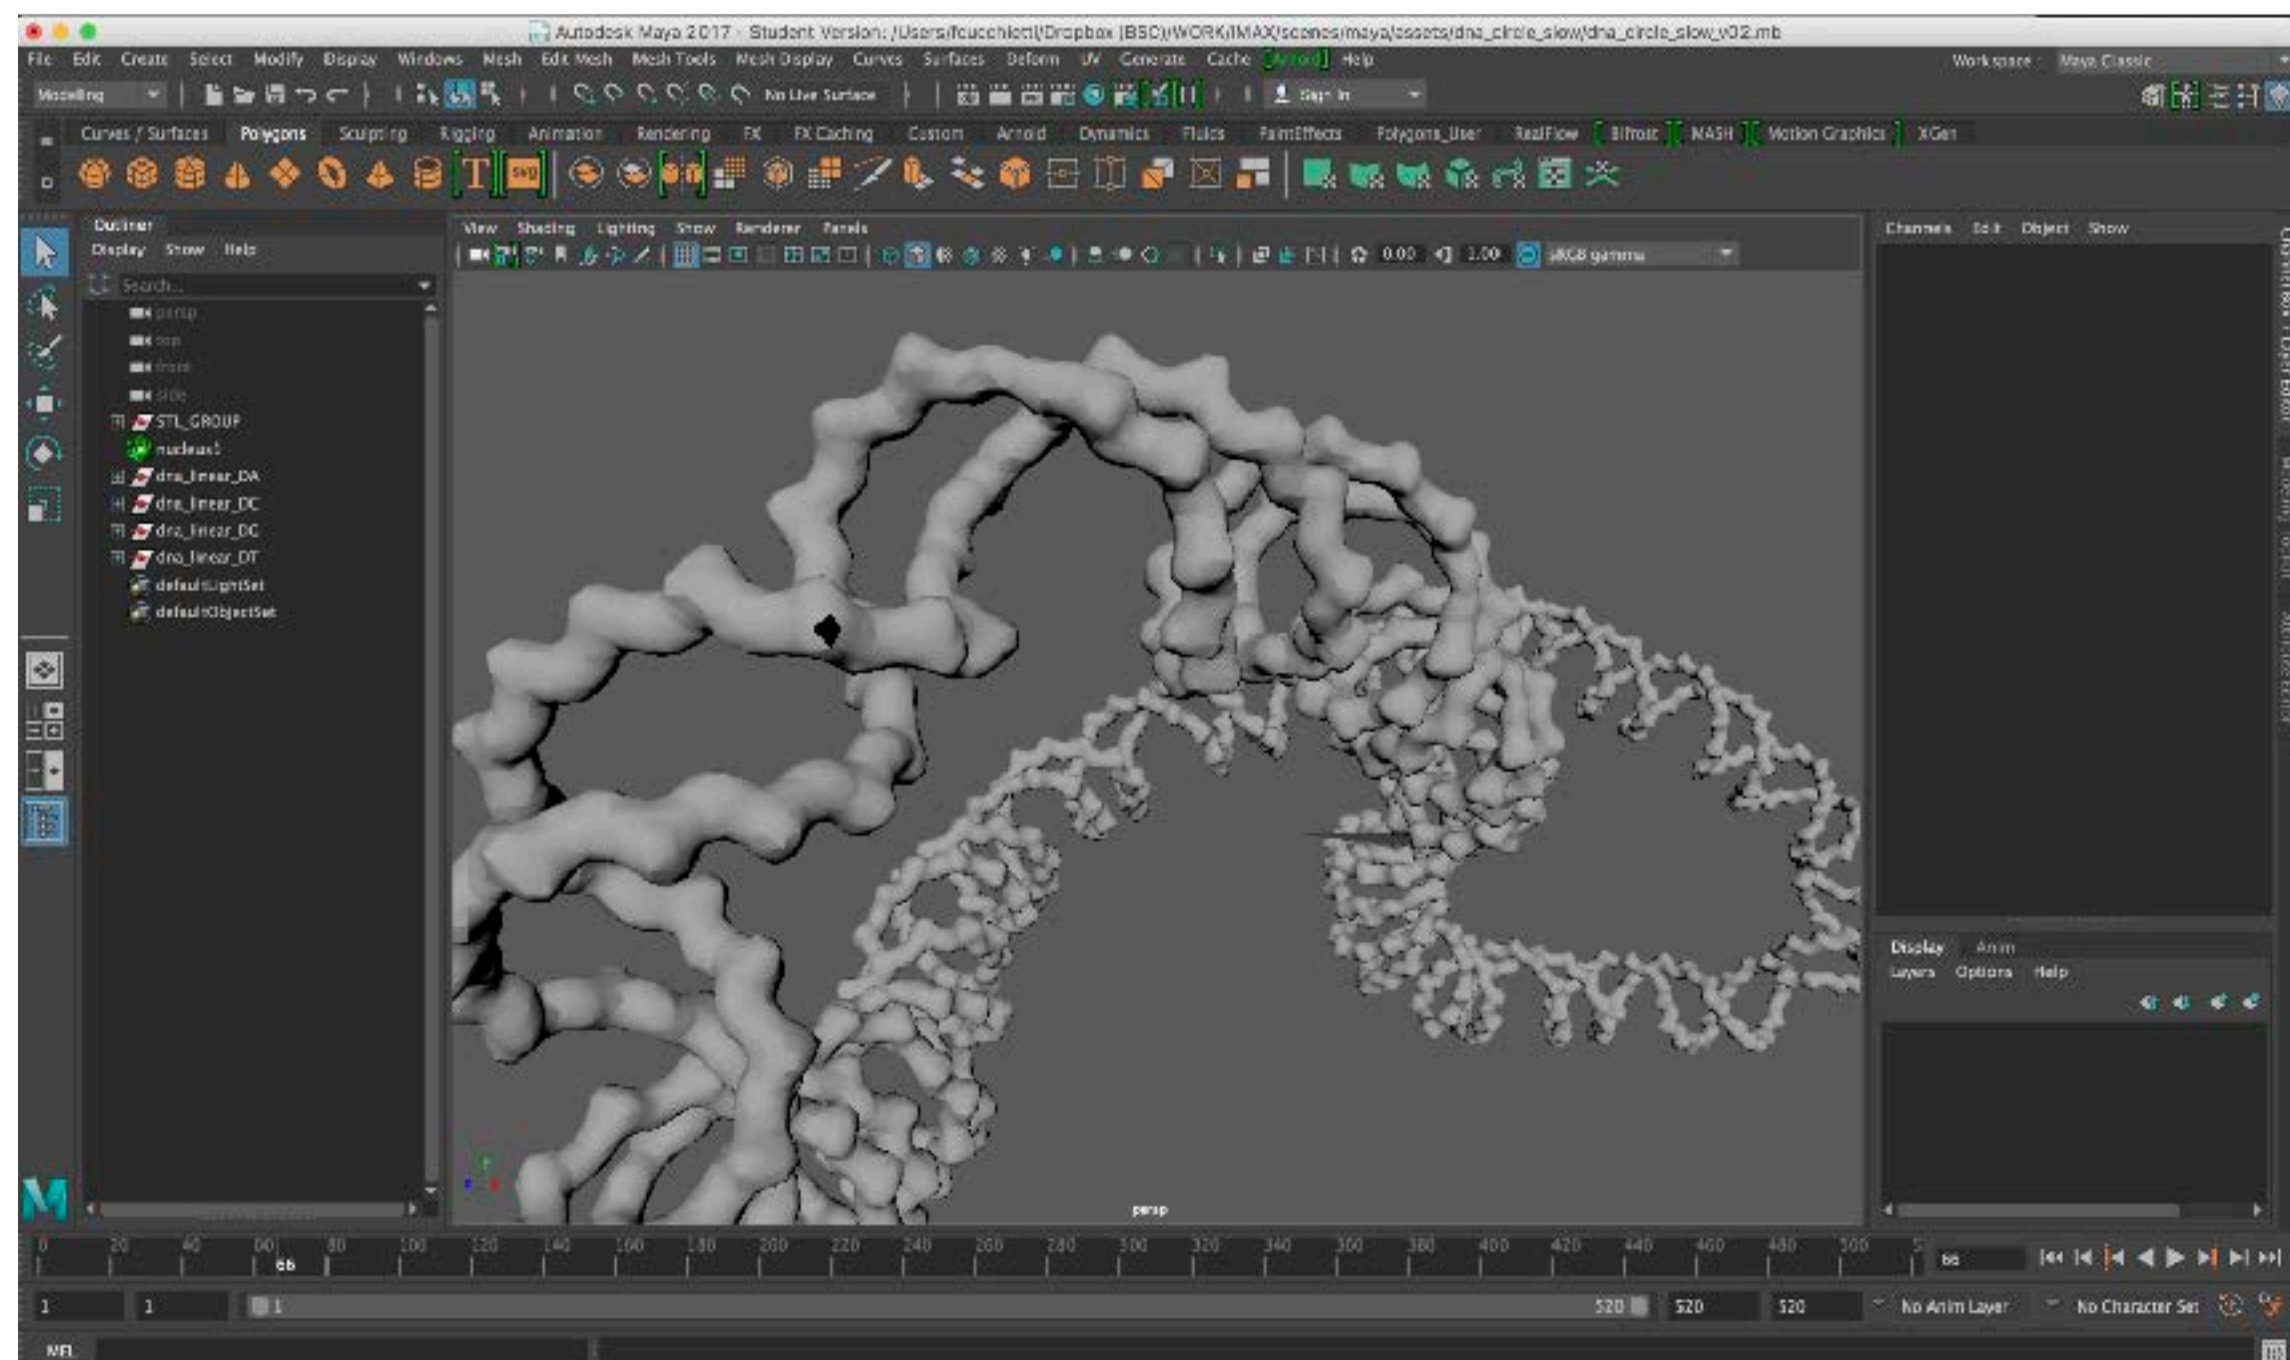

Film industry tools are amazing

Film industry **people** too

Beautiful AND accurate

- Have scientists and artists work together
- Convert data from scientific software/ format into animation industry standards

Hyper cool data visualisation

- Data conversion Tools and plugins
- Leverage standard formats: netcdf, vtk, ensi, geo
- Convert into:
 - volumetric data: Maya cache, OpenVDB
 - point/vector data: Maya cache, Partio
 - surface data: STL, OBJ, FBX, Alembic

Typical pipeline

Load data in
Sci-Viz software

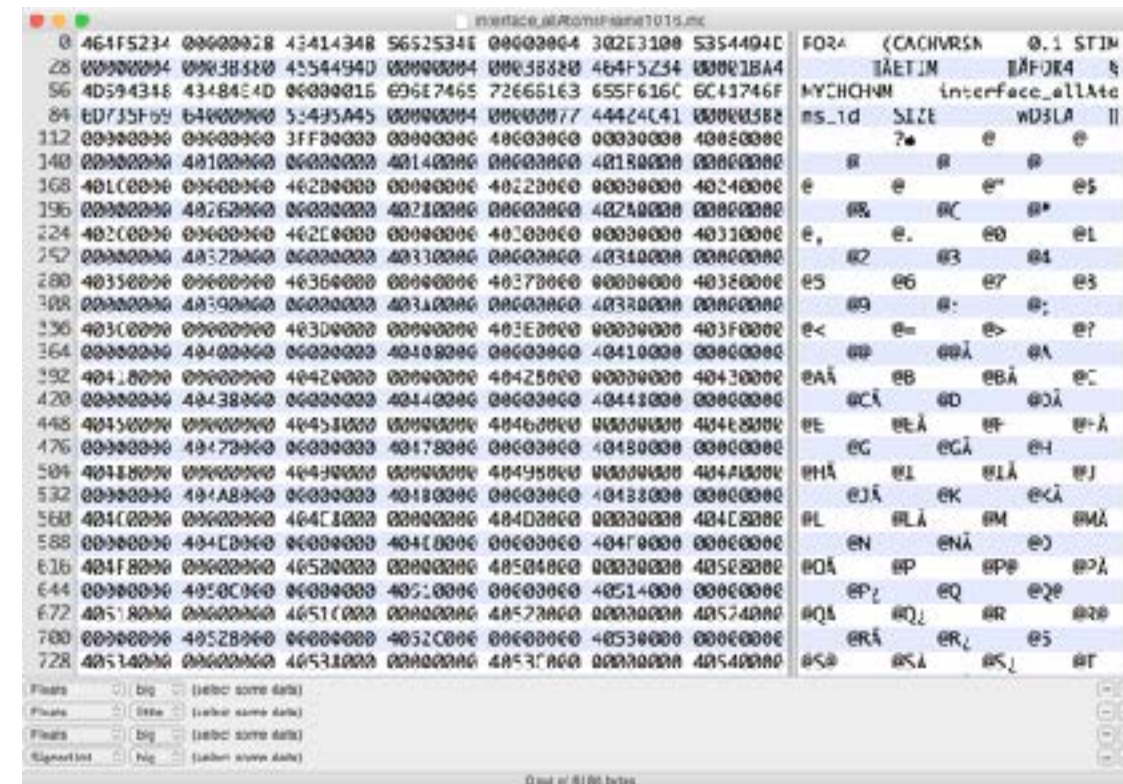

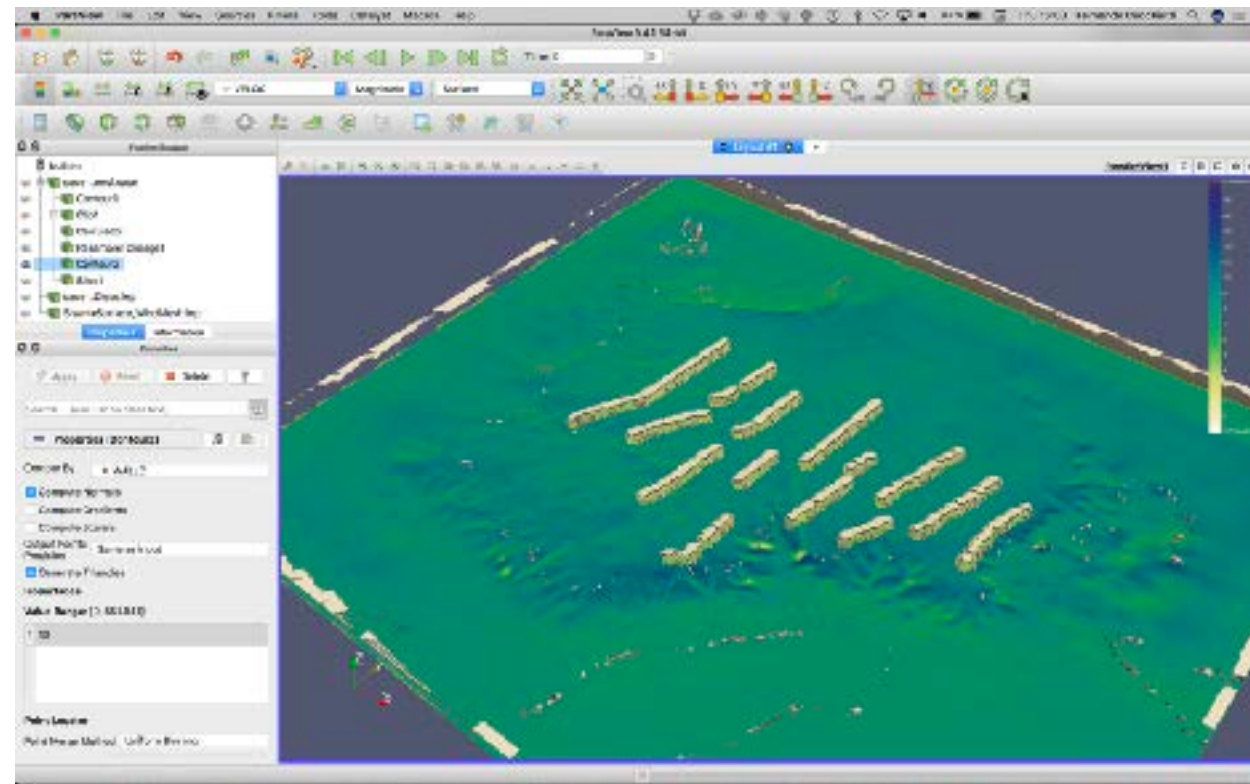

Data forensics
if necessary

Data
Conversion

Fun in Maya,
Blender, etc

Production pipeline

Example CFD

Start-up of a crossflow jet at low blowing ratio
